ELEMENTARY STUDY OF SOILS
AG 150 - A

UNIT OBJECTIVE
After completion of this unit, students should be able to select from a list reasons that soils are important. Students should also be able to discuss soil formation, physical properties and label layers of a soil profile. This knowledge will be demonstrated by completion of assignments sheets, laboratory exercises and a unit test with a minimum of 85 percent accuracy.

SPECIFIC OBJECTIVES AND COMPETENCIES
After completion of this unit, the student should be able to:

1. Match terms associated with soils to the correct definitions.
2. Select reasons that soils are important.
3. Discuss the function of soil as related to plant growth, development and maintenance.
4. Label a drawing showing the composition of an average soil.
5. Select factors that affect soil formation.
6. Name the four physical properties of soil.
7. Identify soil particles according to size.
8. List two methods used to determine soil texture.
9. Identify six kinds of soil structure.
10. Match terms indicating soil depth to their correct descriptions.
11. Match colors of soil to their correct descriptions.
12. Label an illustration showing the layers of a soil profile.
13. Identify on a pH scale the areas of acidity and alkalinity.
14. Discuss the liming of soils to correct soil acidity.
15. Name three types of alkali soils.
16. Discuss reclamation of alkali soils.
17. Use a textural triangle.
18. Determine soil textural class by mechanical analysis.
19. Determine soil textural class by feel.
SUGGESTED ACTIVITIES

I. Suggested activities for instructor

A. Order materials to supplement unit.

1. Literature

   a. *Conserving Soil*, 16-page pamphlet including spirit masters and overhead transparencies; available from U.S. Department of Agriculture, Soil Conservation Service.

   b. *Experiments in Soil Science*, 259 pages; available from VEP, Cal Poly State University, San Luis Obispo, California 93407; approximate cost $10.75; order no. 1-522-820.

   d. *Implications of Acidification of Farmland in Northern Idaho*, available from Agricultural Communications Center, Ag Publications Building, University of Idaho, Moscow, Idaho 83843; approximate cost $.35; order no. CIS 629.

   e. *Liming Materials*, available from Agricultural Communications Center, Ag Publications Building, University of Idaho, Moscow, Idaho 83843; approximate cost $.25; order no. CIS 787.

   f. *The Relationship of Soil pH and Crop Yields in Northern Idaho*, available from Agricultural Communications Center, Ag Publications Building, University of Idaho, Moscow, Idaho 83843; approximate cost $.35; order no. CIS 811.

   g. *Salt- and Sodium-affected Soils*, available from Agricultural Communications Center, Ag Publications Building, University of Idaho, Moscow, Idaho 83843; approximate cost $1.00; order no. EXT 703.

   h. *Soil Characterization Laboratory Procedures Manual*, available from Agricultural Communications Center, Ag Publications Building, University of Idaho, Moscow, Idaho 83843; approximate cost $10; order no. MS 122.

   i. *Soil and Land Judging Handbook*, available from Agricultural Communications Center, Ag Publications Building, University of Idaho, Moscow, Idaho 83843; approximate cost $.50; order no. MS 52.
j. **Soils**, instructional unit; available from Agri-Farm Publications, Inc., 1019 Market Street, Gowrie, Iowa 50543; approximate cost $19.50; order no. 211. Also available—soil class activity packet, approximate cost $8.25; order no. 1108; and soil guide, approximate cost $11.30; order no. 2106.

k. **University of Idaho Soils Handbook**, includes basic soils information and soils-related Current Information Series (CIS) publications published by the College of Agriculture; available from Agricultural Communications Center, Ag Publications Building, University of Idaho, Moscow, Idaho 83843; approximate cost $27.

2. Filmstrips, slideshows, etc.

a. **Introduction to Soils**, 27 slides and cassette; available from Hobar Publications, 1234 Tiller Lane, St. Paul, Minnesota 55112; approximate cost $36.40; order no. D14.

b. **Soil and Its Properties**, slides and script; available from Ohio Agricultural Education Curriculum Materials Service, Room 254, 2120 Fyffe Rd., Ohio State University, Columbus, Ohio 43210; approximate cost $16.75; order no. 50085.

c. **Soil Color**, 47-frame filmstrip; available from Vocational Agriculture Service, University of Illinois, 1401 S. Maryland Dr., Urbana, Illinois 61801; approximate cost $7.05; order no. F708.

d. **Soil Components**, 34 slides and 22-minute cassette; available from Hobar Publications, 1234 Tiller Lane, St. Paul, Minnesota 55112; approximate cost $46.80; order no. D15.

e. **Soil Moisture**, 21 slides and 38-minute cassette; available from Hobar Publications, 1234 Tiller Lane, St. Paul, Minnesota 55112; approximate cost $41.60; order no. D18.

f. **Soil Structure**, 22 slides and 28-minute cassette; available from Hobar Publications, 1234 Tiller Lane, St. Paul, Minnesota 55112; approximate cost $41.60; order no. D17.

g. **Soil Texture**, 44 slides and 34-minute cassette; available from Hobar Publications, 1234 Tiller Lane, St. Paul, Minnesota 55112; approximate cost $83.20; order no. D16.

B. Make transparencies and necessary copies of materials.

C. Provide students with objective sheet and discuss.

D. Provide students with information and assignment sheets, and laboratory exercises.

E. Discuss information and assignment sheets.

F. Demonstrate and discuss procedures outlined in laboratory exercises.
G. Arrange for a field trip to land site for evaluation.

H. Review and give test.

I. Reteach and retest if necessary.

II. Instructional materials

A. Objective sheet

B. Suggested activities

C. Information sheet

D. Transparency masters

1. TM 1--Why Soils Are Important

2. TM 2--Soil-Plant-Animal Cycle

3. TM 3--Composition of Average Soil

4. TM 4--Soil Origins

5. TM 5--Physical Breakdown of Rocks

6. TM 6--The Relative Sizes of Sand, Silt and Clay Particles

7. TM 7--Soil Texture

8. TM 8--Characteristics of the Various Soil Classes

9. TM 9--Permeability Related to Nutrient Capacity

10. TM 10--The Texture Triangle

11. TM 11--Soil Structure

12. TM 12--Hard Pans Effect on Soil Depth

13. TM 13--Soil Profile

14. TM 14--pH Scale

15. TM 15--pH Scale - Relative Strength

16. TM 16--pH Scale - Familiar Products

17. TM 17--pH Scale for Soil Reaction

18. TM 18--pH Requirements of Crops

19. TM 19--Soil pH Governs Nutrient Release...
20. TM 20--Low pH Limits Root Growth
21. TM 21--Ion Exchange of Soil Particles

E. Assignment sheet
   1. AS 1--Using the Textural Triangle

F. Answers to assignment sheet

G. Laboratory exercises
   1. LE 1--Determine Soil Textural Class by Mechanical Analysis
   2. LE 2--Determine Soil Textural Class by Feel

H. Test
I. Answers to test

III. Unit references

A. Agronomy Curriculum Workshop, Iowa State University, Department of Agricultural Education, Ames, Iowa, 1980.

M. *Texas Curriculum Guides*, Vocational Instruction Services, Texas State Board for Vocational Education.

ELEMENTARY STUDY OF SOILS
AG 150 - A

INFORMATION SHEET

I. Terms and definitions

A. Soil--The mineral and organic matter that supports plant growth on the earth's surface; it is a mixture of particles of rock, organic materials, living organisms, air and water

B. Mineral matter--General term for the inorganic elements in the soil, for example: nitrogen, phosphorus, potassium

C. Organic matter--General term for plant and animal material in or on the soil in all stages of decomposition

D. Parent material--The rock and other unconsolidated material from which the soil has developed

E. Soil texture--A name given a textural group based on the relative proportions of the various soil separates (sand, silt and clay)

F. Soil structure--The combination or arrangement of soil particles into aggregates

G. Aggregate--Mass or cluster of soil particles such as a clod, crumb or granule

H. Soil depth--Total thickness of a soil from the topsoil to the parent material

I. Soil color--Indication of the amount of organic matter and moisture of the soil

J. Soil profile--A vertical cross-section of the soil from the surface through all its horizons

K. Soil horizon--A layer of soil approximately parallel to the land surface, differing from other layers in color, structure, texture, pH, etc.

L. Topsoil--The "A" horizon of the soil profile; dark colored upper layer of soil that may vary from several inches to 2 or more feet thick

M. Subsoil--The "B" horizon of the soil profile; the layer of soil directly beneath the topsoil

N. Acid soil--Soil with a pH of less than 7.0; for practical purposes, a soil with a pH of less than 6.6

O. Alkaline soil--Soil having a pH value of greater than 7.0; for practical purposes, a soil having a pH above 7.3

P. Leaching--Removal of water soluble soil components from the soil by the downward action of water
Q. Reclamation--Restoration to a better or useful state, as of wasteland, desert, alkali, etc.

R. Cation--An ion that has lost an electron and has a positive (+) charge, for example: potassium, calcium and magnesium
   (Note: Cations are positively (+) charged and attracted to negative (-) sites on clays and organic matter.)

S. Anion--An ion that has gained an electron and has a negative (-) charge, for example: nitrogen, phosphorus and sulphur
   (Note: Anions are negatively (-) charged and attracted to positive (+) sites.)

T. Exchange capacity--The ability of a soil to absorb ions to the surface of the soil particle
   (Note: Cation exchange capacity is most important in agricultural soils. Anion exchange is very low and confined to low pH soils.)

II. Importance of soils (Transparencies 1, 2)
   A. Plants grow in and on soil
   B. Plants support animal life
   C. Plants and animals support human life
   D. World population is rapidly increasing and/or has inadequate nutrition
   E. Supply of productive soil is limited
   F. Improved soil management could feed more people

III. Function of soil as related to plant growth, development and maintenance
   A. Media for seed germination
   B. Media for support of plants
   C. Storehouse of plant nutrients
   D. Storehouse of water for the plant

IV. Soil composition (Transparency 3)
   A. Solids--Approximately 50%
      1. Mineral matter
      2. Organic matter
      3. Living organisms
B. Pore space--Approximately 50%
   1. Water
   2. Air

V. Factors affecting soil formation (Transparencies 4, 5)

A. Parent materials (Transparency 4)
   1. Residual
      a. Igneous--Derived from molten materials in the center of the earth's crust (granitic, basaltic)
      b. Metamorphic--Formed from the pre-existing rocks through the action of extreme heat and pressures (quartzite, schist)
      c. Sedimentary--Formed from sediments deposited by wind, water or ice (shale, sandstone, limestone)
   2. Transported
      a. Wind (loess)
      b. Water (alluvial)
      c. Glaciers (glacial drift)
      d. Gravity (colluvial)

B. Decomposition by weathering
   1. Physical weathering (Transparency 5)
      a. Wind
      b. Plants and animals
      c. Heating and cooling
      d. Freezing and thawing
      e. Wetting and drying
   2. Chemical weathering--Chemical reactions of water, oxygen and carbon dioxide
   3. Biological weathering--Micro-organisms secrete a gummy substance which aids in decomposing rocks
C. Climate
   1. Temperature
   2. Rainfall

D. Vegetation and organisms
   1. Plant--Lichens, mosses, weeds, grasses, shrubs, trees
   2. Animal--Bacteria, fungi, large animals (cattle, horses, etc.) birds, man

E. Slope and drainage
   1. Hillsides
      a. Thin topsoil due to soil loss by erosion
      b. Reduced plant growth
      c. Low organic matter
      d. Less leaching (due to runoff)
   2. Flat lands
      a. Deeper topsoil
      b. More vegetation
      c. High organic matter
      d. Greater leaching

VI. Physical properties of soil
   A. Soil texture
   B. Soil structure
   C. Soil depth
   D. Soil color

VII. Soil particles (Transparencies 6, 7, 8, 9)
   A. Sand
      1. Diameter--2.00 to 0.05 mm
      2. Coarse and gritty
      3. When moist, individual grains can be seen
4. Its presence decreases water-holding capacity
5. Its presence decreases nutrient holding capacity

B. Silt
1. Diameter--.05 to .002 mm
2. Its presence increases water-holding capacity
3. Its presence increases nutrient holding capacity
4. Moderate to high exchange capacity
5. Feels smooth and velvety

C. Clay
1. Diameter--less than .002 mm
2. Its presence increases water-holding capacity
3. Its presence increases nutrient holding capacity
4. High to very high exchange capacity

VIII. Methods used to determine soil texture

A. Mechanical analysis (Transparency 10)
1. A mechanical analysis of a soil reports the percentage of each of the soil particles (sand, silt and clay)
2. Percentages can be applied to the texture triangle to determine the texture of a soil

B. Feel method
1. Texture is determined by moistening the soil and rubbing between thumb and fingers
   a. The wet sample is worked into a ball and placed between thumb and index finger; the thumb is pushed gradually forward in an attempt to form the soil into a ribbon (clayey soil)
   b. If the wet sample will not form a ribbon, evaluate for grittiness (sandy soil)
   c. Evaluate wet sample to determine if it feels velvety and slick, but will not ribbon (silty soil)
2. Descriptions of soils of different texture using the feel method (Laboratory Exercise #2)

a. Sandy soil
   (1) Coarse and gritty
   (2) When moist, individual grains can be seen
   (3) Called a "light" soil

b. Silty soil
   (1) Feels smooth, flowing when dry
   (2) Feels velvety or slick when wet

c. Clayey soil
   (1) Sticky and will form a ribbon when wet
   (2) Very hard when dry
   (3) Called a "heavy" soil

IX. Types of soil structure  (Transparency 11)

A. Granular (sphere shaped)--Ideal for plant growth

B. Blocky (sharp and angular faces)
   1. Water storage good
   2. Circulation of air and water is poor

C. Platy (flat, horizontal, plate-like)--Poor permeability

D. Prismatic and columnar (column-like)--Poor air-water relationship

E. Single grain

F. Massive

X. Soil depth  (Transparency 12)

A. Depth refers to the total thickness of a soil from the topsoil to the parent material
B. Common measurements are

1. Very deep--over 60" deep
2. Deep--40" to 60" deep
3. Moderately deep--20" to 40" deep
4. Shallow--10" to 20" deep
5. Very shallow--less than 10" deep

(Note: The productive ability of land largely depends upon its depth of soil. Deep soils are necessary to provide the needed water and nutrients for favorable plant production. Shallow soils have a limited capacity for plant nutrients, water and root development.)

XI. Soil color

A. Color is an important characteristic used in the identification of soil conditions that affect the value of land for agricultural uses

B. Influenced mainly by organic matter content; benefits of organic matter include

1. Makes soil porous
2. Supplies nitrogen and other nutrients to the plant
3. Holds water in the soil
4. Reduces leaching
5. Improves soil structure

C. Soil colors

1. Dark brown to black--Regarded as the most productive; usually contains a higher organic matter content
2. Red or reddish brown--Usually less fertile than black or dark brown soils; may contain a high iron content
3. Yellow or gray--Usually caused by imperfect drainage

XII. Soil profile (Transparency 13)

A. Components of the soil profile

1. The "A" horizon
2. The "B" horizon
3. The "C" horizon
B. Characteristics of the soil horizons

1. The "A" horizon
   a. It includes the upper part of the profile in which life is most active; generally called the topsoil
   b. It is the most productive horizon because of its normally high organic matter content and is usually dark colored
   c. May be from a few inches to a foot or more deep
   d. Lighter in texture than the "B" or "C" horizons
   e. More likely to have granular structure than the other horizons

2. The "B" horizon
   a. Generally called the subsoil
   b. Usually lower in organic matter and lighter in color than "A" horizon
   c. Usually red or yellowish in color
   d. Structure is less desirable than the "A" horizon; it may have a blocky or prismatic structure
   e. Frequently heavier texture than "A" horizon

3. The "C" horizon
   a. Generally called parent material
   b. It is the deepest of the three major horizons
   c. Usually very low in organic matter
   d. Usually no structure

XIII. Acidity or alkalinity  (Transparencies 14, 15, 16, 17, 18, 19, 20, 21)

A. The acidity or alkalinity of the soil solution is determined by the relative number of hydrogen (H+) ions and hydroxyl (OH-) ions

B. When a soil solution contains more H+ ions than OH- ions, it is acidic. When the OH- ions are more abundant, the solution is alkaline. A neutral solution has an equal amount of H+ and OH- ions

C. The acidity or alkalinity is expressed in pH values
D. pH ranges on a scale from 1 to 14
   1. 1 to 7—Acidic soil
   2. 7—Neutral soil
   3. 7 to 14—Alkaline soil

(Note: Acidity or alkalinity exert a great influence on the availability of plant nutrients. Plants grow best in pH range 6.0 to 7.5. Poor plant growth is the usual result at pH less than 5.2 or greater than 8.3.)

XIV. Liming soils

A. Soil acidity can be corrected by adding lime to the soil. The function of lime is to neutralize the hydrogen (H+) ions that cause soil acidity

B. Amount of lime to apply depends on
   1. The degree of acidity of the soil
   2. The crops to be grown
   3. The grade or purity of the lime materials
   4. The frequency of application
   5. Soil texture
   6. Soil exchange capacity

XV. Types of alkali soils

A. Saline—Soils in which there has been an accumulation of soluble salts, for example: NaCl (table salt); these are referred to as "white alkali" soils

B. Sodic—Soils in which there has been an accumulation of sodium (Na); sodium affected soils have low permeability to water

(Note: Sodium can solubilize organic matter in the soil. In some instances this happens and the solubilized organic matter is carried to the surface. When dry, this leaves a dark crust on surface of soil. This is called "black alkali" soil.)

C. Saline-sodic—Both salty and sodic affected

(Note: The presence of either salt or sodium greatly affects the potential of a soil for crop production purposes. Their presence affects the water and nutrient uptake by the plant.)
XVI. Reclamation of alkali soils

A. Saline
   1. Flood with water and leach out salts
   2. Install drainage tiles to remove accumulated salts
   3. Grow salt tolerant crops

B. Sodic
   1. Apply gypsum (CaSO₄)
   2. Grow sodic tolerant crops

C. Saline-sodic
   1. First correct sodic
      (Note: This should be done first because of the poor permeability effect of sodium on the soil. This makes leaching of the salts difficult.)
   2. Then correct salt problem
Why Soils Are Important

1. Plants grow in and on soil
2. Plants support animal life
3. Plants and animals support human life
4. World population is rapidly increasing and/or has inadequate nutrition
5. Supply of productive soil is limited
6. Improved soil management could feed more people
Soil-Plant-Animal-Cycle

Soil

Animals

- Animals die returning plant food to soil
- Plants decay

Plants

- Plants are eaten by animals
- Contains food for plants

Returning food to soil
Composition of Average Soil

Air 25%

Mineral matter 45%

Water 25%

Organic matter 5% and living organisms.
Soil Origins

1. Residual
   a. Igneous
   b. Sedimentary
   c. Metamorphic
   d. Organic - peat (from plant life)

2. Transported
   a. Wind (loess)
   b. Water (alluvial)
   c. Ice (glacial till)
Physical Breakdown of Rocks

Figure 2:
A soil particle with mostly hydrogen ions tests ACID

Figure 3:
A soil particle with mostly basic ions tests ALKALINE
PART I

The textural triangle (Figure 1) can be used to determine the textural class of a soil sample. The percentage of sand, silt and clay can be calculated by mechanical analysis.

To use the triangle, locate the percent sand along the bottom of the triangle. From this point move upward and to the left. The percent sand is the same along this line. Next locate the percent clay on the left side of the triangle and move horizontally to the right. The textural class is located where the clay and sand percents meet. This textural class can be checked by locating the silt percentage on the right side of the triangle and moving downward to the left. All points should intersect. If all lines intersect on a division line between classes, move towards the finer textured soil.

PART II

A. How much sand must a soil contain before it is called a

1. Sandy clay loam _________  3. Sand _________
2. Loamy sand _________  4. Sandy clay _________
B. How much clay must a soil contain before it is called a

1. Clay ________ 3. Sandy clay loam ________
2. Clay loam ________ 4. Sandy clay ________

C. Given the relative amounts of sand, clay and silt, find the textural classes of the following:

1. 20% sand
   20% clay
   60% silt ___________________________
2. 55% sand
   40% clay
   5% silt ___________________________
3. 30% sand
   40% clay
   30% silt ___________________________
4. 20% sand
   70% clay
   10% silt ___________________________
5. 85% sand
   10% clay
   5% silt ___________________________
ANSWERS TO ASSIGNMENT SHEET

1. **Part I**--Evaluated to satisfaction of instructor.

2. **Part II**

   A. 1. 45% 2. 70% 3. 85% 4. 45%
   B. 1. 40% 2. 27% 3. 20% 4. 35%
   C. 1. Silt loam
      2. Sandy clay
      3. Clay
      4. Clay
      5. Loamy sand

   E. A variety of soil samples

II. Procedure
   A. Fill the quart fruit jar 1/2 full of soil
   B. Add 5-6 tablespoons of calgon solution and neatly fill the quart jar with water
   C. Put the lid on the jar and shake for 5 minutes. Let the jar stand for 24 hours
   D. Measure the depth of the settled soil at the end of 24 hours. This is the total depth
   E. Thoroughly shake for 5 minutes. Let the jar set
   F. Measure the depth of the settled soil at the end of 40 seconds. This is the sand layer
   G. Measure the depth of the settled soil at the end of 30 minutes
   H. Subtract the first depth (sand) from this new depth of soil. This is the depth of the silt layer
   I. Subtract the depth of sand and silt from the original total depth to determine the amount of clay
   J. Calculate the percentage of each soil separately by dividing the depth of each soil separately by the original total depth (Figure 1)
K. Determine the soil textural classification by using the soil textural triangle (Figure 2)
LABORATORY EXERCISE #2--DETERMINE SOIL TEXTURAL CLASS BY FEEL

Name ______________________________________________  Score ______________________

I. Equipment needed

A. Spray bottle filled with water

B. Sink (to wash hands)

C. Paper towels

D. A variety of soil samples

II. Procedure

A. Review soil textural class characteristics

1. Sand or loamy sand: Dry--loose, single grained; gritty; no or very weak clods; Moist--gritty; forms easily crumbled ball; does not ribbon; Wet--lacks stickiness, but may show faint clay stainings (loamy sand especially); Individual grains can be both seen and felt under all moisture conditions

2. Sandy loam: Dry--clods break easily; Moist--moderately gritty to gritty; forms balls that stands careful handling; ribbons very poorly; Wet--definitely stains fingers; may have faint smoothness or stickiness, but grittiness dominates; Individual grains can be seen and felt under nearly all conditions

3. Loam: This is the most difficult texture to place since characteristics of sand, silt and clay are all present but none predominates; Suggests other textures; Dry--clods slightly difficult to break; somewhat gritty; Moist--forms firm ball; ribbons poorly; may show poor fingerprint; Wet--gritty, smooth and sticky all at same time; Stains fingers

4. Silt or silt loam: Dry--clods moderately difficult to break and rupture suddenly to a floury powder that clings to fingers; shows fingerprint; Moist--has smooth, slick, velvety or buttery feel; forms firm ball; may ribbon slightly before breaking; shows good fingerprint; Wet--smooth with some stickiness from clay; stains fingers; Grittiness of sand is well masked by other separates; (Texture most like silt loam; there are few silt soils)

5. Sandy clay loam: Dry--clods break with some difficulty; Moist--forms firm ball that dries moderately hard; forms 1/2" ribbons that hardly sustain own weight; may show poor to good fingerprint; Wet--grittiness of sand and stickiness of clay about equal, masking smoothness of silt; stains fingers
6. Clay loam: Dry--clods break with difficulty; Moist--forms firm ball that dries moderately hard; ribbons fairly well, but ribbons barely support own weight; shows fair to good fingerprint; Wet--moderately sticky with stickiness dominating over grittiness and smoothness; stains fingers

7. Silty clay loam: Resembles silt loam but with more stickiness of clay; Dry--clods break with difficulty; Moist--shows a good fingerprint; forms a firm ball drying moderately hard; ribbons 1/2" that can be fairly thin; Wet--stains fingers; has sticky-smooth feel with little grittiness of sand

8. Sandy clay: Dry--often cloddy, clods broken only with extreme pressure; Moist--forms very firm ball, drying quite hard; shows fingerprint; squeezes to thin, long, somewhat gritty ribbon; Wet--stains fingers; clouds water; usually quite sticky and plastic, but has some grittiness present

9. Silty clay: Dry--see sandy clay; Moist--forms very firm ball becoming quite hard on drying; shows fingerprint; squeezes out to a thin, long, smooth ribbon; Wet--stains fingers; clouds water; stickiness dominates over smoothness, grittiness is virtually absent

10. Clay: Dry--cloddy, clods often cannot be broken even with extreme pressure; Moist--forms firm, easily molded ball drying very hard; squeezes out to a very thin ribbon 2 to 3 inches long; Wet--stains fingers, clouds water; usually very sticky with stickiness masking both smoothness and grittiness; wets slowly

B. Examine the dry soil sample

(Note: Look for clods and ease of crumbling them between your fingers. Remember soils high in sand are seldom cloddy. Soils high in silt may be cloddy but usually break easily. Clay soils are usually cloddy and are often hard to break.)

C. Take a quantity of soil about the size of a golf ball. Moisten it with water from the spray bottle to the consistency of putty

D. Try to form a ball with the moistened soil sample; then try to form a "ribbon" by working the soil between the thumb and forefinger

(Note: Soils high in sand feel gritty and ribbon poorly unless also high in clay. Soils high in silt feel smooth or floury. They may also form a short ribbon in varying length depending on the clay content. Soils high in clay can be rolled out into very thin ribbons.)

E. Saturate the soil sample and note staining on the fingers

(Note: Clay or loam soil is indicated if the moist soil ball stains your fingers.)

F. Compare several soil samples of different textures

(Note: Compare the amount of grittiness of sand to the smoothness of silt and the stickiness of clay. Sand gives a grinding sound when held close to the ear. Grittiness indicates a sandy soil. Silt is smooth and velvety. Clay is sticky.)
ELEMENTARY STUDY OF SOILS

AG 150 - A

UNIT TEST

Name_________________________________ Score_________________________________

1. Match terms associated with elementary study of soils to the correct definition. Write the correct numbers in the blanks.

   _____a. A mixture of particles of rock, organic materials, living organisms, air and water 1. Soil
   _____c. Total thickness of a soil from the topsoil to the parent material 3. Organic matter
   _____d. Dark colored upper layer of soil that may vary from several inches to 2 or more feet thick 4. Parent material
   _____e. A vertical cross-section of the soil from the surface through all its horizons 5. Soil texture
   _____f. Mass or cluster of soil particles such as a clod, crumb or granule 6. Soil structure
   _____g. Soil having a pH value greater than 7.0 7. Aggregate
   _____h. General term for inorganic elements in the soil 8. Soil depth
   _____i. A name given a textural group based on the relative proportions of the various soil separates 9. Soil color
   _____j. A layer of soil approximately parallel to the land surface, differing from other layers in color, structure, texture, pH, etc. 10. Soil profile
   _____k. The layer of soil directly beneath the topsoil 11. Soil horizon
   _____l. General term for plant and animal material in or on the soil in all stages of decomposition 12. Topsoil
   _____m. Indication of the amount of organic matter and moisture of the soil 13. Subsoil
   _____n. Soil with a pH of less than 7.0 14. Acid soil
   _____o. Soil having a pH of greater than 7.0 15. Alkaline soil
   _____p. General term for leaching or reclamation 16. Leaching
   _____q. General term for plant and animal material in or on the soil in all stages of decomposition 17. Reclamation
   _____r. Indication of the amount of organic matter and moisture of the soil 18. Cation
   _____s. Soil with a pH of less than 7.0 19. Anion
   _____t. Soil having a pH of greater than 7.0 20. Exchange capacity
2. Select from the following list reasons that soils are important. Write an "X" in the blank before each correct answer.

   ____ a. Holds the earth together
   ____ b. Provides food
   ____ c. Population is increasing
   ____ d. Productive soil is limited
   ____ e. Provides insulation

3. Discuss the function of soil as related to plant growth, development and maintenance.

   ____________________________________________
   ____________________________________________
   ____________________________________________
   ____________________________________________
   ____________________________________________
   ____________________________________________
4. Label the drawing below showing the composition of an average soil. Write the correct names in the blanks.

5. Select from the following list factors that are important in soil formation. Write an "X" in the blank before each correct answer.

   _____ a. Freezing and thawing of parent material
   _____ b. The amount of rainfall
   _____ c. The type of soil structure
   _____ d. The steepness or flatness of the landscape
   _____ e. The presence of clay in the "B" horizon
   _____ f. The amount of vegetation present

6. Name the four physical properties of soil.

   a. ____________________________________________
   b. ____________________________________________
   c. ____________________________________________
   d. ____________________________________________
7. Identify the soil particles according to size.

8. List two methods used to determine soil texture.
   a. _______________________________________________________
   b. _______________________________________________________

9. Identify the six kinds of soil structure in the illustration below.

   ![Soil Structure Diagram]

   a. ________________ b. ________________ c. ________________
   d. ________________ e. ________________ f. ________________
10. Match terms indicating soil depth to their correct description. Write the correct numbers in the blanks.

   _____ a. 40 to 60 inches deep   1. Shallow
   _____ b. 20 to 40 inches deep   2. Moderately deep
   _____ c. 10 to 20 inches deep   3. Deep
   _____ d. Less than 10 inches deep 4. Very shallow
   _____ e. Over 60 inches deep   5. Very deep

11. Match the colors of the soil to their correct description. Write the correct numbers in the blanks.

   _____ a. High iron content   1. Dark brown to black
   _____ b. Caused by imperfect drainage 2. Red or reddish-brown
   _____ c. High organic matter content 3. Yellow or gray

12. Label the illustration showing the layers if a soil profile. Write the correct names in the blanks.

13. Identify on the pH scale the area of acidity and the area of alkalinity.
14. Discuss the liming of soils to correct soil acidity.

___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________

ELEMENTARY STUDY OF SOILS
AG 150 - A

ANSWERS TO TEST

1. a. 1  h. 2  o. 18
   b. 16  i. 5  p. 20
   c. 8  j. 11  q. 17
   d. 12  k. 13  r. 6
   e. 10  l. 3  s. 4
   f. 7  m. 9  t. 19
   g. 15  n. 14

2. b, c, d

3. Answer should include the following information:
   Media for seed germination; Media for support of plants; Storehouse of plant nutrients; Storehouse of water for the plant

4. a. Air
   b. Water
   c. Mineral matter
   d. Organic matter and living organisms

5. a, b, d, f

6. Soil structure; Soil texture; Soil depth; Soil color

7. a. Silt
   b. Sand
   c. Clay

8. Mechanical analysis; Feel method

9. a. Single grain
   b. Blocky
   c. Platy
   d. Massive
   e. Granular
   f. Prismatic

10. a. 3  b. 2  c. 1  d. 4  e. 5

11. a. 2  b. 3  c. 1

12. a. "A" horizon
    b. "B" horizon
    c. "C" horizon

13. Acid--pH values less than 7.0
    Alkaline--pH values greater than 7.0
14. Answer should include the following information: The function of lime is to neutralize hydrogen (H\(^+\)) ions that cause soil acidity; Amount of lime to apply depends on the degree of acidity of the soil, crops to be grown, grade or purity of lime materials, frequency of application, soil texture and soil exchange capacity

15. Saline; Sodic; Saline-sodic

16. Discussion should include the following information:

**Saline:** Flood with water and leach out salts; Install drainage tiles to remove accumulated salts; Grow salt tolerant crops

**Sodic:** Apply gypsum; Grow sodic tolerant crops

**Saline-sodic:** Correct sodic problem first, then salt problem
SOIL FERTILITY

AG 150 - B

UNIT OBJECTIVE

After completion of this unit, students should be able to match function and deficiency symptoms to the correct nutrient and select factors that influence the use of fertilizers. Students should also be able to list sources of nutrients, match fertilizers to their descriptions and complete a soil test report form. This knowledge will be demonstrated by completion of assignment sheets and a unit test with a minimum of 85 percent accuracy.

SPECIFIC OBJECTIVES AND COMPETENCIES

After completion of this unit, the student should be able to:

1. Match terms associated with soil fertility to the correct definitions.
2. Match the functions of nutrients for crop growth to the correct nutrient.
3. Match nutrients to their correct deficiency symptoms.
4. Select factors that influence the use of fertilizers.
5. Discuss major points in collecting and handling a representative soil sample.
6. List four sources of nutrients.
7. Match types of fertilizers to their correct description.
8. Calculate problems comparing cost per pound of nutrient.
9. List three methods of fertilizer application.
10. Complete a soil test report form.
SOIL FERTILITY
AG 150 - B

SUGGESTED ACTIVITIES

I. Suggested activities for instructor

A. Order materials to supplement unit.

1. Literature

a. Crop Management Series--No-Till and Minimum Tillage Farming: Fertilizer Band Location for Cereal Root Access, available from Agricultural Communications Center, Building J40, University of Idaho, Moscow, Idaho 83843-4196, (885-7982); approximate cost $.50; order no. PNW 283.

b. Fertilizer Placement, available from Agricultural Communications Center, Building J40, University of Idaho, Moscow, Idaho 83843-4196, (885-7982); approximate cost $.35; order no. CIS 757.

c. Fertilizer Primer: Terminology, Calculations and Application, available from Agricultural Communications Center, Building J40, University of Idaho, Moscow, Idaho 83843-4196, (885-7982); approximate cost $.35; order no. CIS 863.

d. How to Calculate Manure Application Rates in the Pacific Northwest, available from Agricultural Communications Center, Building J40, University of Idaho, Moscow, Idaho 83843-4196, (885-7982); approximate cost $.25; order no. PNW 239.

e. Making Soil Fertility Decisions, 120-page instructional unit; available from IAVIM Center, 208 Davidson Hall, Iowa State University, Ames, Iowa 50011; approximate cost $7.50; order no. 226.

f. Pamphlets on fertilizer use; available from Potash and Phosphate Institute, 2801 Buford Hwy., N.E., Suite 401, Atlanta, Georgia 30329; approximate cost 25¢ each.

g. Principles of Soil Sampling, available from Agricultural Communications Center, Building J40, University of Idaho, Moscow, Idaho 83843-4196, (885-7982); approximate cost $.50; order no. WREP 9.

h. Soil Sampling, available from Agricultural Communications Center, Building J40, University of Idaho, Moscow, Idaho 83843-4196, (885-7982); approximate cost $.50; order no. EXT 704.
i. Taking Soil Samples, 25-page instructional manual; available from IAVIM Center, ATTN: Thomas A. Hoerner, 208 Davidson Hall, Iowa State University, Ames, Iowa 50011; approximate cost $2.50; order no. 212.

j. University of Idaho Soils Handbook; includes basic soils information and soils-related Current Information Series (CIS) publications published by the College of Agriculture; available from Agricultural Communications Center, Building J40, University of Idaho, Moscow, Idaho 83843-4196, (885-7982); approximate cost $27.

k. Using the Soil Test Report Form, available from Agricultural Communications Center, Building J40, University of Idaho, Moscow, Idaho 83843-4196, (885-7982); approximate cost $.25; order no. CIS 363.

2. Filmstrips, slideshows, etc.

a. Fertilizer Purchase, 1 disk and worksheet; available from Teaching Aids, Inc., P.O. Box 1789, Costa Mesa, California 92626; approximate cost $22.00; order no. ACS-9.

b. Fertilizer Quarterly, 1 disk and worksheet; available from Teaching Aids, Inc., P.O. Box 1789, Costa Mesa, California 92626; approximate cost $22.00; order no. ACS-10.

c. Fertilizers and Soil Fertility, 3 cassettes, 3 filmstrips, program guide and reproducible masters; available from Teaching Aids, Inc., P.O. Box 1789, Costa Mesa, California 92626; approximate cost $105.00; order no. P1321.

d. Soil pH and Limestone, 7 slides, cassette and 1 film loop, 24 minutes; available from Hobar Publications, 1234 Tiller Lane, St. Paul, Minnesota 55112; approximate cost $31.20; order no. D21.

e. Soil Sampling and Soil Testing, 63-frame filmstrip and script; available from IAVIM Center, 208 Davidson Hall, Iowa State University, Ames, Iowa 50011; approximate cost $8.75; order no. 314.

B. Make transparencies and necessary copies of materials.

C. Provide students with objective sheet.

D. Provide students with information and assignment sheets.

E. Discuss unit and specific objectives.

F. Discuss information and assignment sheets.

G. Take soil sample from schoolyard or school farm for analysis.

H. Have students bring a soil sample from home farm for analysis.
I. Develop a fertilizer test plot for students to observe different fertilizing methods, rates and results.

J. Contact local fertilizer dealer for samples of different fertilizers.

K. Review and give test.

L. Reteach and retest if necessary.

II. Instructional materials

A. Objective sheet

B. Suggested activities

C. Information sheet

D. Transparency masters
   1. TM 1--Nitrogen Deficiency in Corn
   2. TM 2--Phosphate Deficiency in Corn
   3. TM 3--Potash Deficiency in Corn
   4. TM 4--Factors That Influence Fertilizer Use
   5. TM 5--Soil Sampling (A-B)
   6. TM 6--Soil Sampling (C-D)
   7. TM 7--Soil Sampling (E-F)
   8. TM 8--Soil Sampling (G-H)
   9. TM 9--Soil Sampling
   10. TM 10--Soil Sample Bag

J. Texas Curriculum Guide, Vocational Instruction Services, Texas State Board for Vocational Education.

SOIL FERTILITY

AG 150 - B

INFORMATION SHEET

I. Terms and definitions

A. Essential nutrient--Element necessary for plant growth and reproduction, for example: nitrogen, phosphorus and potassium

B. Deficiency--Plant condition where an essential nutrient is not sufficiently available

C. Symptom--A visual sign or condition that results from a deficiency; symptoms aid in diagnosing a deficiency

D. Fertilizer--Natural, manufactured or processed material or mixture of materials that contains one or more of the essential nutrients; available in dry, liquid or gaseous form

E. Analysis--Percentage water soluble content of nitrogen (N), phosphorus (P) expressed as P2O5, and potassium (K) expressed as K2O in the fertilizer

F. Brand--Trademark of the company which produced the fertilizer

G. Complete fertilizer--Fertilizer which supplies all three of the primary nutrients (N, P, K)

II. Functions of nutrients for crop growth

A. Carbon, hydrogen and oxygen are needed in the plant processes of photosynthesis and respiration

(Note: Importance of photosynthesis to net gain in weight should be emphasized. Approximately 95% of weight of crop plants comes from products of photosynthesis.)

B. Primary nutrient functions

1. Nitrogen (N)
   a. Gives green color to plant
   b. Induces vigorous, rapid growth in plants
   c. Increases protein and yield
d. Aids and promotes seed and fruit development

(Note: Excess nitrogen causes vegetative growth and poor seed and fruit production. Nitrogen constitutes 80% of the atmosphere, yet it is one of the most critical elements for plant growth. The reason is that plants cannot utilize nitrogen as a gas; it must be combined with other elements into a plant available form.)

2. Phosphorus (P)
   a. Important to germinating seedlings
   b. Contributes to early maturing crops
   c. Necessary for seed and fruit formation
   d. Stimulates root growth

3. Potassium (K)
   a. Necessary for production and translocation of carbohydrates
   b. Produces plumper seeds
   c. Controls water intake and respiration
   d. Stiffens straw and stalks

C. Secondary nutrient functions

1. Sulphur (S)
   a. Necessary for nodule formation on legumes
   b. Associated with plant enzyme systems
   c. Stimulates seed production
   d. Affects protein and crop quality

2. Calcium (Ca)
   a. Speeds decay of organic matter
   b. Stimulates formation of nitrates
   c. Promotes root and leaf growth
   d. Necessary for nodulation of legumes
3. Magnesium (Mg)
   a. Necessary for chlorophyll or green plant color
   b. Increases absorption of phosphorus
   c. Aids in formation of fats and oils
   d. Important in plant enzyme system

III. Symptoms of nutrient deficiencies

   A. Primary nutrient deficiency symptoms

      1. Nitrogen (N) (Transparency 1)
         a. Stunted and spindly
         b. Yellow, yellowish-green or light green color in foliage (chlorosis)
         c. Older leaves affected first
            (Note: Yellowing or browning starts at the tip and moves along the middle of the leaf. This occurs first on the lowest leaves of the plant.)

      2. Phosphorus (P) (Transparency 2)
         a. Stunted growth
         b. Very dark green color
         c. Purple leaves or portions of leaves in advanced stages
         d. Older leaves affected first

      3. Potassium (K) (Transparency 3)
         a. Shorter plants
         b. Bronzing or browning of leaf color
         c. Lodging (bending of the stem) occurs
            (Note: Leaves show yellow to brown coloring along leaf margins followed by complete browning.)

   B. Secondary nutrient deficiency symptoms

      1. Sulphur (S)
         a. Young plants have stunted appearance
         b. Leaves have a light-green to yellow coloring
c. Stems are thin and spindly

(Note: Sulphur deficiency symptoms are similar in appearance to nitrogen deficiency symptoms.)

2. Magnesium (Mg)

a. Leaf parts between veins show a whitish color

b. Leaf tissue becomes yellow, veins remain green (interveinal chlorosis)

c. Leaves curl upward along the margins

(Note: It is important to note that other conditions besides nutrient shortages may cause abnormal plant growth. Cold, wet weather, lack of sunlight, disease, insect damage and improperly applied chemicals are examples.)

IV. Factors that influence fertilizer use (Transparency 4)

A. Fertility of the soil

(Note: The fertility of the soil is dependent on the availability of total nutrients in the soil, soil organic matter and can be determined by soil test.)

B. Physical condition of the soil

(Note: Moisture content, soil texture, soil structure and the ability to prevent leaching are important physical conditions to consider in fertilizer use.)

C. Crop to be grown

(Note: Nutrient needs vary between crop plants. The cost of the type of fertilizer compared to the value of the crop is an important consideration.)

D. Climatic conditions, such as temperature and moisture

E. Time of application--fall, spring or during season

V. Soil testing to determine nutrient needs (Transparencies 5, 6, 7, 8, 9, 10, 11)

(Note: If you apply fertilizer that is not needed, you are wasting money. On the other hand, you will lower crop yields if you don't apply enough. Confusing? Sure. That's why soil testing is so highly recommended. A soil test is a guide to fertilizer needed for your farm. Consult your cooperative extension agent or refer to the "Soils Handbook" published by the College of Agriculture, University of Idaho, for more information on procedure and cost.)

A. Five main steps involved in taking a good soil sample

1. Obtain needed materials for the sample

2. Select a good time to take the sample
3. Select good sampling areas

4. Collect representative samples

5. Send the sample to a soil testing laboratory

(Note: Soil tests are only as good as the samples taken.)

B. Materials needed for sampling

1. Soil auger or shovel to take soil cores

(Note: Always use clean tools so sample will not be contaminated.)

2. Plastic pail for mixing core samples

(Note: Mix sample well so sample will be representative of soil cores.)

3. Soil sample bags and information sheet

4. Map of your fields

C. When to take sample

1. After harvest, before fall fertilization

2. Spring, before spring fertilization

(Note: Do not sample after a lime, fertilizer or manure application or when soil is excessively wet. Sampling at other times such as in winter or in a growing crop can be satisfactory if you can divide the field into uniform sampling areas and take soil samples at the proper depth.)

D. Choosing good sampling areas

1. Sampling areas depend on field size and soil types in field

2. Sampling area should represent an area with similar past management and soil types

(Note: Soil survey maps from local SCS may be helpful in determining areas with common soil type, slope and erosion. If a recent soil survey map is not available, sampling areas should be separated on the basis of visual differences, such as texture, color and slope. Avoid areas not representative of the uniform field area, such as old fence lines, eroded areas, etc.)
E. Collecting representative samples

1. Take 8 to 12 separate cores in a zig-zag pattern from a ten-acre sampling area

<table>
<thead>
<tr>
<th></th>
<th>1</th>
<th>3</th>
<th>5</th>
<th>7</th>
<th>9</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>4</td>
<td>6</td>
<td>8</td>
<td>10</td>
<td></td>
</tr>
</tbody>
</table>

2. Take 10 to 15 cores if the area is variable

3. Take core samples by 12 inch increments

(Note: For nitrogen, sulphur and other mobile nutrients, sample to rooting depth. For phosphorus, potassium and the micronutrients, sample to 12 inches.)

4. Place cores in a clean, plastic pail and mix cores thoroughly

(Note: Be sure to clear away any plant material or surface trash where core is to be taken. Plastic pail is recommended because the sample can absorb nutrients (especially zinc) from the metal coating on the bucket and give you erroneous results on the soil test.)

F. Sending sample to be tested

1. Each soil sample bag should be identified and numbered before filling

(Note: Label all samples correctly and identify area on farm map where sample was taken.)

2. Fill soil sample bag one-half to two-thirds full with thoroughly mixed soil from pail

3. Securely close the bag

4. Complete the soil test report

(Note: Information on cropping history and the crop to be grown is usually required on information sheet for accurate fertilizer recommendations.)

5. Send samples and the completed soil test report to the desired soil testing laboratory

(Note: Be sure to indicate type of soil test desired. Some of the more common tests are the following: phosphorus, potassium, nitrogen, organic matter, zinc, sulphur and soil pH. Consult county agent or soil specialist in your area for the soil tests you need.)
Note: In Idaho, take samples to local county agent, or mail to:

Soil Testing Laboratory
Ag Science Building
University of Idaho
Moscow, ID 83843

G. How often to test soil

1. Each field should be sampled every 3 to 5 years or once in a crop rotation; nitrogen should be run each year

(Note: If fertilizer applications do not appear to be beneficial, resampling should be done.)

VI. Completing a soil test report form--Interpreting soil test results

(Note: Numbers are meaningless without interpretation. Interpretations are based on research on response of the crop at various soil test levels. Fertilizer guides are available for most agronomic crops raised in Idaho. These guides are used in conjunction with the University of Idaho soil test results, but may also be used with soil test results from private laboratories. Each guide is specific to a crop and an area of the state. The fertilizer guides are accurate if: (1) the soil sample submitted was properly taken and represents the area to be fertilized, (2) the crop to be grown and previous history are known, and (3) reasonable management occurs.)

VII. Nutrient sources (Transparency 12)

A. Animal manure--The liquid and solid excrement of animals mixed with bedding material; used to supply nutrients for plant growth; helps add organic matter to the soil

(Note: Organic matter is the soil's storehouse for nitrogen. Almost all of the N in the soil is part of the organic matter. When organic matter decomposes, N is released and changes to available forms for plant use. The nutrient content of animal manure may vary considerably under different livestock production systems, amount and type of bedding and methods of handling the manure produced.)

B. Crop residues--Leaves, stems, roots and other parts of plants remaining in the field after harvest, for example: wheat stubble, corn stover, potato vines, sugarbeet tops, etc.

C. Green manure crops--A crop grown to be plowed under in a green, succulent condition for soil improvement purposes; usually a legume crop which fixes atmospheric nitrogen, such as black peas, clover or vetch

D. Commercial fertilizers--Commercially prepared plant nutrients are applied to soils to increase their productivity by supplying additional essential nutrients

VIII. Types of fertilizers

A. Liquid--Fertilizer made by dissolving the correct proportion of the solid plant nutrient carriers into water; may be in solution or suspension
B. Dry mixed--Granulated fertilizer made by combining selected plant nutrient materials to obtain certain ratios and quantities of plant nutrients

C. Gas--Liquid fertilizer containing solid fertilizer materials which is dispensed under pressure and usually contains a higher analysis than clear liquid mixes

IX. Comparing costs of fertilizer materials (Transparencies 13, 14)

(Note: Compare fertilizer prices on the basis of cost per pound of nutrient, not on the cost per pound of fertilizer material.)

A. Calculating cost per pound of nutrients:

<table>
<thead>
<tr>
<th>Price of Fertilizer Per Pound of Material</th>
<th>Guaranteed Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: Fertilizer analysis -- 20 - 10 - 10</td>
<td>7.5¢/lb = 18.75¢/lb of nutrient</td>
</tr>
<tr>
<td>Fertilizer cost -- $150.00/ton or 7.5¢/lb</td>
<td>40%</td>
</tr>
</tbody>
</table>

B. Calculating cost of materials that contain only one nutrient

(Note: The same formula is used.)

Example: Fertilizer analysis -- 45 - 0 - 0 (Urea)

Fertilizer cost -- $240.00/ton or 12¢/lb

\[
\frac{12\text{¢/lb}}{0.45} = 26.6\text{¢/lb of N}
\]

X. Methods of fertilizer application

A. Broadcast

1. Truck mounted fertilizer spreader
2. Trailer mounted fertilizer spreader
3. Truck mounted liquid fertilizer applicator
4. Field sprayer
5. Aerial application

B. Soil injection

1. Anhydrous ammonia
2. Nitrogen liquid solution under pressure
C. Banding
   1. Dry fertilizer with planter
   2. Liquid or suspension fertilizer with planter
   3. Liquid or suspension with side dress application

D. With irrigation water
Nitrogen deficiency in corn

Small ears and low protein content result from N deficiency.

Yellowing starts at tip and moves along middle of leaf.
PHOSPHATE deficiency in corn

P SHORTAGE MARKS LEAVES WITH REDDISH-PURPLE COLOR

P CONTROLS STALK SIZE AND EAR SET; WHEN THERE'S A SHORTAGE, STALKS ARE WEAK, SPINDLY AND OFTEN BARREN OF EARS

P IS NEEDED WHEN EARS ARE SMALL AND TWISTED AND KERNELS ARE UNDEVELOPED

P SHORTAGE DURING EARLY WEEKS CAUSES A SHALLOW ROOT SYSTEM WITH LITTLE SPREAD
POTASH deficiency in corn

POORLY FILLED TIPS AND LOOSE CHAFFY KERNELS RESULT FROM K DEFICIENCY

NORMAL K DEFICIENCY

K IS NEEDED WHEN SLICE-AWAY REVEALS NODES ARE DISCOLORED DARK BROWN

K DEFICIENCY CAUSES FIRING OR DRYING ALONG THE TIPS AND EDGES OF LOWEST LEAVES
Factors That Influence Fertilizer Use

1. Chemical condition of the soil
2. Physical condition of the soil
3. Crop to be grown
4. Climatic conditions
5. Time
SOIL Sampling

A

FOLLOW INSTRUCTIONS CAREFULLY

Obtain cartons and information sheets from local agricultural authorities.

B

Soil Probe

Soil Auger

Spade or Shovel

Garden Trowel

SAMPLING TOOLS
DO NOT SAMPLE UNUSUAL AREAS: eroded areas, fence lines, terrace channels, windbreaks, near trees, wet spots, boundaries between slopes & bottom land, etc.,

DIVIDE FIELDS INTO UNIFORM AREAS FOR SAMPLING depending on soil types, topography, etc.
SOIL SAMPLING

FIELD CROP AREA

PASTURE AREA

COLLECT A COMPOSITE SAMPLE FROM 10–15 PLACES

WITH A SPADE OR GARDEN TROWEL DIG A V-SHAPED HOLE, THEN TAKE A ½" SLICE FROM THE SMOOTH SIDE OF THE HOLE.
SOIL SAMPLING

NUMBER EACH SAMPLE & RECORD ITS ORIGIN

FOLLOW SOIL TEST RECOMMENDATIONS
1. Identity and number each sample before filling.
2. Fill soil sample bag 1/2 to 2/3 full with mixed soil from pit.
3. Securely close the bag.
4. Complete soil test report form by filling in field information section and checking the soils tests desired.
5. Send immediately to testing laboratory.

## CHECK TEST REQUIRED: Please make checks payable to Bursar, University of Idaho.

- Standard Fertility Test* (910.00)

  *Includes drying and grinding (81.90), pH, P, K and O.M.

- Bicarbonate P & K
- Acetate P & K

### OTHER TESTS:

- pH (soil reaction) § 1
- Available P (ppm P) § 3
- Available K (ppm K) § 3
- Organic matter (%) § 3
- Sulfate-S (ppm S) § 3
- Boron (ppm B) § 5
- Total Salts (E.C.) (mhos/cm) § 2
- Gypsum Requirement $20
- Lime Requirement § 4
- Cation Exchange Capacity (meq/100g) § 7
- Zinc (ppm Zn) § 4
- Copper (ppm Cu) § 4
- Manganese (ppm Mn) § 4
- Iron (ppm Fe) § 4

### NITRATE N (ppm) | AMMONIUM N (ppm) | AVAIL. MOIST. (INCHES) |

ASSIGNMENT SHEET #2--COMPLETE A SOIL TEST REPORT FORM

Name _______________________________  Score _______________________________

Secure a soil sample and answer the necessary information concerning the crop to be grown and the cropping history of the plot. Check the type of soil test desired. Have the sample analyzed. Using fertilizers available in your community and local prices, recommend the fertilizers to use and the amount. When completed, return to instructor for evaluation and discussion purposes.

(Note: Soil Test Report Forms, fertilizer guides and instructions may be obtained from your local cooperative extension agent.)

SOIL FERTILITY

AG 150 - B

ANSWERS TO ASSIGNMENT SHEETS

Assignment Sheet #1

Cost will vary according to local cost of fertilizers.

Assignment Sheet #2

Evaluated to satisfaction of instructor.
SOIL FERTILITY

UNIT TEST

Name ______________________________________ Score __________________________________

1. Match terms associated with soil fertility to the correct definitions. Write the correct numbers in the blanks.

   _____a. Natural, manufactured or processed material or mixture of materials that contains one or more of the essential nutrients; available in dry, liquid or gaseous form

1. Essential nutrient

   _____b. Plant condition where an essential nutrient is not sufficiently available

2. Deficiency

   _____c. Percentage water soluble content of nitrogen (N), phosphorus (P) expressed as P₂O₅ and potassium (K) expressed as K₂O in the fertilizer

3. Symptom

   _____d. Trademark of the company which produced the fertilizer

4. Fertilizer

   _____e. A visual sign or condition that results from a deficiency; aids in diagnosing a deficiency

5. Analysis

   _____f. Fertilizer which supplies all three of the primary nutrients (N, P, K)

6. Brand

   _____g. Element necessary for plant growth and reproduction, for example: nitrogen, phosphorus and potassium

7. Complete fertilizer

2. Match the functions of nutrients for crop growth to the correct nutrient. Write the correct numbers in the blanks.

   _____a. Gives dark green color to plant; promotes rapid growth; increases protein and yields; aids and promotes seed and fruit development

1. Nitrogen (N)

   _____b. Speeds decay of organic matter; stimulates formation of nitrates; promotes root and leaf growth; is necessary for nodulation of legumes

2. Phosphorus (P)

   _____c. Necessary for production and translocation of carbohydrates; produces plumper seeds; controls water intake and respiration; stiffens straw and stalks

3. Potassium (K)

   _____d.

4. Sulphur (S)

   _____e.

5. Calcium (Ca)

   _____f.

6. Magnesium (Mg)
d. Necessary for chlorophyll or green plant color; increases absorption of phosphorus; aids in formation of fats and oils; important in plant enzyme system

e. Important to germinating seedlings; contributes to early maturing crops; necessary for seed and fruit formation; stimulates root growth

f. Necessary for nodule formation on legumes; associated with plant enzyme systems; stimulates seed production; affects protein and crop quality

3. Match nutrients to the correct deficiency symptoms. Write the correct numbers in the blanks.

a. Stunted and spindly; yellow, yellowish-green or light green color in foliage; older leaves affected first

b. Stunted growth; very dark green color; purple leaves in advanced stages; older leaves affected first

c. Shorter plants; bronzing or browning of leaf color; lodging occurs

d. Young plants have stunted appearance; leaves light green to yellow color; stems are thin and spindly

e. Leaf parts between veins show a whitish color; interveinal chlorosis; leaves curl upward along the margins

4. Select from the following list factors that influence the use of fertilizers. Write an "X" in the blank before each correct answer.

a. Fertility of soil

b. Crops to be grown

c. Physical condition of soil

d. Insects

e. Climatic conditions

f. Diseases

g. Time of application
5. Discuss the major points in collecting and handling a representative soil sample.

_______________________________________________________________________________
_______________________________________________________________________________
_______________________________________________________________________________
_______________________________________________________________________________
_______________________________________________________________________________
_______________________________________________________________________________
_______________________________________________________________________________
_______________________________________________________________________________

6. List four sources of nutrients.
   a. _____________________________________________________________________________
   b. _____________________________________________________________________________
   c. _____________________________________________________________________________
   d. _____________________________________________________________________________

7. Match the types of fertilizers to the correct description. Write the correct numbers in the blanks.
   a. Granulated fertilizer made by combining selected plant nutrient materials to obtain certain ratios and quantities of plant nutrients
   b. Liquid fertilizer containing solid fertilizer materials which is dispensed under pressure and usually contains a higher analysis than clear liquid mixes
   c. Fertilizer made by dissolving the correct proportion of the solid plant nutrient carriers into water; may be in solution or suspension

   1. Liquid
   2. Dry mixed
   3. Gas
8. By calculating the cost per pound of nitrogen for each of the following fertilizers, determine which is the cheapest source of nitrogen. Show all work.

   a. 34-0-0 (ammonium nitrate) at $122/ton

   ____________________________
   ____________________________
   ____________________________

   b. 82-0-0 (anhydrous ammonia) at $160/ton

   ____________________________
   ____________________________
   ____________________________

   c. Cheapest source of N is ____________________________

9. List three methods of fertilizer application.

   a. ____________________________

   b. ____________________________

   c. ____________________________
SOIL FERTILITY
AG 150 - B

ANSWERS TO TEST

1. a. 4  e. 3
    b. 2  f. 7
    c. 5  g. 1
    d. 6

2. a. 1  d. 6
    b. 5  e. 2
    c. 3  f. 4

3. a. 3  b. 5  c. 4  d. 2
    e. 1

4. a, b, c, e, g

5. Answer should include information from the following: (for more detailed information, refer to pages 150B-9 - 150B-12)

Steps involved in taking a good soil sample; Materials needed to collect sample; When to take sample; Sampling area; Collecting a representative sample; Sending sample to be tested; How often to test soil

6. Animal manure; Crop residues; Green manure crops; Commercial fertilizers

7. a. 2  b. 3  c. 1

8. a. 18¢/lb of N
    b. 10¢/lb of N
    c. 82-0-0 (anhydrous ammonia)

9. Answer should include three of the following:

Broadcast; Soil injection; Banding; With irrigation water
UNIT OBJECTIVE

After completion of this unit, students should be able to list the components of different irrigation systems, determine water intake rates and available moisture, and calculate irrigation frequency. Students should also be able to discuss factors that affect the selection of irrigation systems. This knowledge will be demonstrated by completion of assignment sheets and a unit test with a minimum of 85 percent accuracy.

SPECIFIC OBJECTIVES AND COMPETENCIES

After completion of this unit, the student should be able to:

1. Match terms associated with irrigation to the correct definitions.
2. List three reasons for irrigating.
3. Select factors that affect water intake rates.
4. Calculate the total available moisture of a soil.
5. Name three methods used for estimating soil moisture in the crop root zone.
6. Calculate days remaining until next irrigation.
7. Name two units of volume measurement and two units of flowrate measurement of water.
8. Convert cubic feet per second into other units of water measurement.
10. Name four types of irrigation systems.
11. Match the basic parts of a surface irrigation system to the correct definitions.
12. Match the basic parts of sprinkler irrigation system to the correct definitions.
13. Select factors that affect the selection of irrigation systems.
14. Discuss costs involved with irrigation.
IRRIGATION
AG 150 - C

SUGGESTED ACTIVITIES

I. Suggested activities for instructor

A. Order materials to supplement unit.

1. Literature

   a. *Farm Drainage*, instructional package, 10 pages notes, 26 transparencies; available from Hobar Publications, 1234 Tiller Lane, St. Paul, Minnesota 55112.

   b. *Planning for an Irrigation System*, a paperback discussing different irrigation systems; available from AAVIM, 120 Engineering Center, Athens, Georgia 30602.

   c. The following Current Information Series (CIS) publications are available from Agricultural Communications Center, Building J40, Idaho Street, University of Idaho, Moscow, Idaho 83843-4196 (208-885-4196).

      - *Application of Agricultural Chemicals in Pressurized Irrigation Systems*, approximate cost $.35; order no. CIS 673.
      - *Available Water-Holding Capacities of Soils in Southern Idaho*, approximate cost $.35; order no. CIS 236.
      - *Buying a Low Energy Irrigation System*, approximate cost $.25; order no. CIS 572.
      - *Investment Costs for Center Pivot Systems*, approximate cost $.25; order no. CIS 579.
      - *Investment Costs for Gravity Irrigation Systems*, approximate cost $.35; order no. CIS 578.
      - *Investment Costs for Sprinkler Systems*, approximate cost $.35; order no. CIS 577.
      - *Irrigation Runoff Control Strategies*, approximate cost $.25; order no. PNW 287.
      - *Irrigation Scheduling*, approximate cost $.25; order no. PNW 288.
      - *Irrigation System Walk-Through Inspection Analysis*, approximate cost $.25; order no. PNW 293.
Reducing Soil Losses with Filter Strips, approximate cost $.35; order no. CIS 587.

Solid Set Sprinkler Systems, approximate cost $.35; order no. CIS 272.

2. Filmstrips, slideshows, etc.
   a. Irrigation, 6 cassettes, 6 filmstrips and study guide; available from Teaching Aids, Inc., P. O. Box 1798, Costa Mesa, California 92626; approximate cost $229.00; order no. B263.
   b. The Irrigation System Explained, 6 filmstrips and 6 cassettes; available from Agrimedia Corporation, Garden City, New York 11530; approximate cost $154.00; order no. 401.

B. Make transparencies and necessary copies of materials.
C. Provide students with objective sheet and discuss.
D. Provide students with information and assignment sheets and discuss.
E. Review and give test.
F. Reteach and retest if necessary.

II. Instructional materials
   A. Objective sheet
   B. Suggested activities
   C. Information sheet
   D. Transparency masters
      1. TM 1--Soil Texture and Water Intake Rates
      2. TM 2--Average Water Holding Capacity of Soils Representing Different Textural Classes
      3. TM 3--Effective Root Zones of Common Crops
      4. TM 4--Soil Moisture Scheduling Procedure
      5. TM 5--Crop Stress Point
      6. TM 6--Units of Water Measurement
      7. TM 7--Conversion of Units of Water Measurement
      8. TM 8--Equivalent Rate of Flow
      9. TM 9--Types of Weirs
10. TM 10--Types of Flumes
11. TM 11--Types of Flowmeters
12. TM 12--Parts of a Surface Irrigation System
13. TM 13--Level Systems of Surface Irrigation
14. TM 14--Graded Systems of Surface Irrigation
15. TM 15--Parts of a Sprinkler Irrigation System
16. TM 16--Common Types of Sprinklers
17. TM 17--Types of Sprinkler Irrigation Systems
18. TM 18--Factors That Affect the Selection of Irrigation Systems
19. TM 19--Comparison of Investment Costs for Irrigation Systems

E. Assignment sheets
1. AS 1--Calculate Total Available Moisture
2. AS 2--Calculate Days Until Next Irrigation
3. AS 3--Calculate Irrigation Length
4. AS 4--Convert Units of Water Measurement

F. Answers to assignment sheets

G. Test

H. Answers to test

III. Unit references

I. Terms and definitions

A. Irrigation--To supply land with water by means of ditches, sprinklers or other system

B. Soil texture--A name given a textural group based on the relative proportions of the soil separates (sand, silt, clay)

C. Soil structure--The combination and arrangement of soil particles (sand, silt, clay) into aggregates

D. Slope--A measurement of difference in elevation from one point to another; it is generally referred to as a percent--the number of feet difference in elevation for 100 feet of horizontal distance

E. Water table--The level at which the soil is saturated with water; usually below the soil surface

F. Soil profile--A vertical cross-section of the soil from the surface through all its horizons

G. Root zone--That part of the soil profile from which growing plants can utilize water and nutrients

H. Irrigation frequency--The number of days between irrigations

I. Weir--An obstruction placed in a stream or channel diverting the water through a device to measure the flow of water; types include rectangular, cipolleti and v-notch

J. Measuring flume--Chute placed in a stream or channel to measure the flow of water

K. Flowmeter--A device used for measuring water flow from a well or pipeline

L. Corrugate--A series of parallel furrows commonly used in surface irrigation systems to direct the flow of water between seedbeds

M. Ditch--Channel for carrying water for drainage or irrigation of the soil

N. Tilth--The physical condition of soil as related to its ease of tillage and fitness as a seedbed
II. Reasons for irrigating

A. Provide water for crops in the right amount at the right time

(Note: Some areas have sufficient yearly rainfall, but it does not come when the crop needs it most. Crops suffer because the time between rainfalls is too long, drought conditions occur, plants suffer and yields decrease.)

B. Increase crop yield

(Note: Reasons that yields increase when ample water is available from irrigation are (1) better assurance of a good stand, (2) more plants per acre can be grown, (3) more efficient use of fertilizer, and (4) improved varieties can be planted.)

C. Improve crop quality

(Note: Many examples from research and experience can be cited to show that irrigation improves quality. Fruit is larger and more uniform in size. Ears of corn are more uniform and you get a larger percentage of No. 1 potatoes.)

III. Soil properties that affect water intake rates

A. Soil texture (Transparency 1)

1. Coarse sand - 0.75-1.00 inches/hr
2. Fine sands - 0.50-0.75 inches/hr
3. Fine sandy loams - 0.35-0.50 inches/hr
4. Silt loams - 0.25-0.40 inches/hr
5. Clay loams - 0.10-0.30 inches/hr

B. Soil structure

(Note: Soil structure plays an important part in the productivity of different soils, affecting the ease with which roots can penetrate, the water intake rate and the movement of water in the soil.)

C. Slope

(Note: As the slope of a field increases, the chance for the water to run off before entering the soil increases.)

D. Other factors

1. Presence of impermeable layer in soil profile
2. General tilth of surface soil
3. Moisture content of the soil profile
IV. Total available moisture of the soil (Transparency 2)

A. The amount of water that can be held in the soil which is available for crop use

(Note: The soil profile is much like a sponge, the sponge having the capability to absorb water. Like the soil profile, the sponge has a saturation point where it cannot absorb any more water.)

1. Factors that affect total available moisture
   a. Texture of surface and subsurface horizons
   b. Depth of the soil profile

(Note: If a layer is present in the soil profile which is impenetrable to water, air and roots, the soil depth would be that part of the profile above this layer.)

B. Information needed to calculate the total available moisture for a crop growing in a soil

1. Soil type
2. Water holding capacity of that soil type
3. Root zone depth (Transparency 3)

Example: A crop, alfalfa, is growing in a loamy textured soil which has a water holding capacity of 1.69 inches of moisture per foot. The average root zone is four feet. What is the total available moisture of the root zone?

\[
1.69 \text{ inches/foot} \times 4 \text{ feet} = 6.75 \text{ inches}
\]

V. Estimate soil moisture in crop root zone

A. Plant and field methods--Crop stress point is determined by the plant showing signs of moisture stress

(Note: Plant symptoms that indicate moisture stress include wilted leaves and color change in leaves. By the time symptoms are noticeable, considerable damage has been done to the plant. This is not a recommended procedure for determining soil moisture.)

B. Feel method for estimating soil moisture

(Note: The use of this method of determining soil moisture requires much experience for the results to be very accurate. A pamphlet is available from the University of Idaho College of Agriculture, miscellaneous series #39, that describes soil types, percent available moisture and characteristics of each for a ball test, ribbon test and open-palm test. This method can be acceptable once fingertips are "calibrated".)
C. Tensiometers--Mechanical devices placed at several representative places in a field to measure soil moisture

(Note: Tensiometers are usually placed at two depths in the root zone. This is an accurate way of determining soil moisture to guide you in irrigation scheduling.)

VI. Soil moisture scheduling procedure (Transparency 4)

A. Determine total available moisture of crop root zone

Example: Potatoes on silt loam soil

1. Root zone depth (from Table 1)--2.0 ft.

Table 1
Effective Crop Root Zone Depth (no soil barriers)

<table>
<thead>
<tr>
<th>Crop</th>
<th>Depth (ft)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alfalfa</td>
<td>4.0</td>
</tr>
<tr>
<td>Beans</td>
<td>2.0</td>
</tr>
<tr>
<td>Field corn</td>
<td>3.0</td>
</tr>
<tr>
<td>Sweet corn</td>
<td>2.5</td>
</tr>
<tr>
<td>Mint</td>
<td>2.0</td>

<td>1.0</td>
</tr>
<tr>
<td>Sandy loam</td>
<td>1.5</td>
</tr>
<tr>
<td>Loam, silt loam, clay</td>
<td>2.2</td>
</tr>
</tbody>
</table>

3. Total available moisture of crop root zone--2 ft x 2.2 in/ft = 4.4 in
B. Determine present soil moisture available for crop use

1. Determine present soil moisture

(Note: When using feel method, use soil auger to check moisture in crop root zone. Estimate soil moisture in 1 foot increments, or obtain information from reading on tensiometer to determine average soil moisture of crop root zone.)

Example: Potato field monitored on July 25. Soil moisture determinations indicate there is 80% available moisture in the first foot, 90% in the second foot or a crop root zone average of 85%

2. Crop stress point (from Table 3)--65% (Transparency 5)

<table>
<thead>
<tr>
<th>Crop</th>

3. Percent moisture remaining for plant use: 85 - 65 = 20%

(Note: In this example, 100% available moisture is equivalent to 4.4 inches of water. Therefore, the amount of water remaining for plant use: 4.4 inches x 20% = 0.88 inches.)

C. Estimate crop water use

1. Find water use ($E_t$) from estimated crop water use table in newspaper

(Note: $E_t$ = evapotranspiration loss of water from the soil both by evaporation and by transpiration from the plants or crop water use. For more information contact your county agent, fieldman or irrigation consultant.)

Example: $E_t$ for potatoes on July 25 of 0.27 inches/day
D. Calculate days remaining until next irrigation

Example: \(.88 \div 0.27 = 3.3\) days; therefore, the next irrigation should be July 28

VII. Units of water measurement (Transparency 6)

A. Volume measure

1. Gallons
2. Acre-inches--Amount of water required to cover one acre one inch deep (27,154 gallons)
3. Acre-feet--Amount of water required to cover one acre one foot deep (325,850 gallons)

B. Flow rate

1. Gallons per minute
2. Cubic feet per second
3. Miner's inch

VIII. Conversion of units of water measurement (Transparencies 7, 8)

1 gallon = 231 cubic inches = 8.33 lbs
1 cubic foot = 7.48 gallons = 62.4 lbs
1 acre-foot = 43,560 cubic feet
= 325,850 gallons
= 12 acre-inches
1 acre-inch = 27,154 gallons
= 8,630 cubic feet

1 gallon per minute = 0.00223 cubic feet per second

1 cubic ft per second = 7.48 gallons per second
= 450 gallons per minute
= 646,272 gallons per day (24 hours)
= 1.983 acre-feet per day (24 hours)
= 50 miner's inches in Idaho

IX. Common measuring devices for water in motion

A. Weirs (Transparency 9)

1. Rectangular weirs

(Note: Originally used but aren't very accurate because the deeper the head of water, the greater the pressure and flow of water over the crest of the weir.)
2. Cipolleti weirs
   (Note: Angle of side walls compensates for the pressure due to additional height of water coming over the weir. This is the most accurate and is most commonly used.)

3. V-notch weirs
   (Note: This weir is relatively accurate but not a common weir. It is used mainly to measure small streams which come from small pumps.)

B. Flumes (Transparency 10)
   1. Cutthroat
   2. Parshall
   3. Trapezoidal

C. Flow meters (Transparency 11)

X. Types of irrigation systems
   A. Surface
   B. Sprinkler
   C. Trickle
   D. Subsurface

XI. Surface irrigation (Transparency 12)
   A. Water is applied on the ground at the ground level; it flows by gravity over the surface of the fields
   B. Basic parts of a surface irrigation system
      1. Water supply
         (Note: Common sources of water include: farm ponds, rivers, canals and wells.)
      2. Field supply line--The means by which water is delivered from the source to the field; it may be an open ditch or a pipeline
         (Note: The ditch may be unlined or lined with such materials as concrete, asphalt or plastic. The most commonly used materials for pipelines are steel, aluminum, plastic, asbestos cement and concrete.)
3. Head ditch or head pipeline--The means by which water is made available from the field supply line to the different areas of the field

(Note: The head ditch or head pipeline extends along one end or one side of the field to be irrigated.)

4. Turnouts--Used for releasing the water from the head ditch or pipeline onto the land to be irrigated

(Note: On a head ditch, turnouts may be flood gates or siphon tubes. On a pipeline, turnouts may be gates such as on gated pipe or hydrant valves.)

5. Tail water ditch--Used for collecting excess water for reuse

(Note: The tail water ditch is located at the end or side of the field opposite to the head ditch. This arrangement is important for several reasons: it allows a higher flow rate through the irrigated strip which increases the uniformity of water application; it saves the excess water and makes it available for reuse by pumping it back to the head ditch or pipe, or into another area to be irrigated.)

C. Types of surface irrigation systems

(Note: Surface systems are designed to fit two conditions: (1) level land--that with less than .1 percent slope, and (2) sloping land--that with .1 percent slope to as much as 15 percent. The type of surface system you consider will be determined by the amount of slope you have in the area you plan to irrigate.)

1. Level systems (Transparency 13)
   a. Border
   b. Contour levee
   c. Furrow

2. Graded systems (Transparency 14)
   a. Border
   b. Contour ditch
   c. Furrow
   d. Corrugation
   e. Contour furrow

XII. Sprinkler irrigation

A. Water is sprayed through the air and it falls to the ground like rain; this is accomplished by using either one or more rotating sprinklers or spray nozzles
B. Basic units of a sprinkler system (Transparency 15)

1. Pumping unit--Takes water from its source and makes it available under pressure to the system

(Note: Pumping units are driven either by an electric motor or an internal combustion engine.)

2. Mainline pipe--Delivers the water from the pumping unit to the laterals

(Note: Mainline pipe may be either permanent or portable. Pipe installed above ground is usually steel or aluminum. Pipe installed below ground is usually plastic, asbestos cement or steel.)

3. Lateral pipe--Delivers the water from the mainline pipe to the sprinklers

(Note: Lateral pipe is of the same type and materials as mainline pipe but usually a smaller size.)

4. Sprinklers--Located at intervals along the lateral, the sprinklers break up the water into various size drops and distribute over the ground

a. Types of sprinklers (Transparency 16)

   (1) Rotary sprinklers

   (2) Spray-type nozzle

C. Types of sprinkler irrigation systems (Transparency 17)

1. Solid set (permanent)

2. Hand lines (portable)

3. Lateral move (self-propelled)

4. Center pivot (self-propelled)

5. Big guns (portable or self-propelled)

XIII. Factors that affect the selection of different types of irrigation systems (Transparencies 18, 19)

A. Land slope

B. Water intake rate of soil

C. Water tolerance of crops

D. Wind action

E. Shape of field
F. Maximum height of crop

G. Labor required

H. Cost

XIV. Irrigation costs

(Note: The specific costs involved will depend on the type of irrigation system.)

A. Initial costs

1. Well (drilling, casing)

2. Reservoir pump (line shaft, propeller, turbine, centrifugal)

3. Power unit (electric, gasoline, diesel, natural gas or propane)

4. Miscellaneous (electric switch, gas line, fuel tank, land plane, land development)

5. Water pipe (underground or above ground)

6. Pipe trailer

7. Sprinkler systems (hand-moved, tractor-moved, self-moved, self-propelled, permanent)

8. Surface systems (land grading)

9. Subsurface systems (ditches, pipelines)

10. Land drainage, etc.

B. Annual depreciation cost (based on)

1. Initial cost of system

2. Interest

3. Taxes and insurance

4. Fixed charges (for example, stand-by charges for electricity)

5. Loss of income from land taken out of production for water development

6. Life expectancy of system

C. Annual operating cost

1. Fuel

2. Oil
3. Electricity
4. Equipment repair and maintenance
5. Reservoir and field maintenance
6. Water use charges
7. Labor

### Fibrous Root

![Root System Diagram]
Soil Moisture Scheduling Procedure

1. Determine total available moisture of crop root zone.
2. Determine present soil moisture available for crop use.
3. Determine crop stress point, and calculate percent moisture remaining for plant use.
4. Estimate crop water use from E$_{\text{t}}$ table.
5. Calculate days remaining until next irrigation by dividing the number of inches of water remaining by the E$_{\text{t}}$ value.

ASSIGNMENT SHEET #1--CALCULATE TOTAL AVAILABLE MOISTURE

Using the information given, calculate the total available moisture (TAM) of the soil and how much water will be applied at each irrigation. Assume that irrigation will take place when 50% of the water has been depleted from the root zone. When completed, return to instructor for evaluation.

a. Corn is growing in a silt loam soil (TAM of 2.55 inches/ft) with an average root zone of 7 feet.

   TAM ________________________________

   Amount to apply ____________________

b. Wheat is growing in a sandy loam soil (TAM of 1.67 inches/ft) with an average root zone of 2 feet.

   TAM ________________________________

   Amount to apply ____________________

c. Alfalfa is growing in a silty clay soil (TAM of 2.91 inches/ft) with average root zone of 6 feet.

   TAM ________________________________

   Amount to apply ____________________
Using the information given, calculate the number of days until next irrigation. Round numbers to the lesser whole number. When completed, return to instructor for evaluation.

a. Barley

Soil type--silt loam
Root zone depth--3.5 feet
Average soil moisture--80%
Crop stress point--40%
E_t--.05

b. Potatoes

Soil type--sand
Root zone depth--2.0 feet
Average soil moisture--90%
Crop stress point--65%
E_t--.27

c. Corn

Soil type--sandy loam
Root zone depth--3.0 feet
Average soil moisture--75%
Crop stress point--50%
E_t--.30

d. Sugarbeets

Soil type--loam
Root zone depth--3.0 feet
Average soil moisture--70%
Crop stress point--50%
E_t--.27
IRRIGATION

ASSIGNMENT SHEET #3--CALCULATE IRRIGATION LENGTH

Name ___________________________  Score ___________________________

Using the information given, calculate the length of each irrigation in hours. When completed, return to instructor for evaluation.

a. A medium texture soil has a water intake rate of .25 inches per hour. How many hours will it take to apply 3 inches of water?

b. A light texture soil has a water intake rate of .50 inches per hour. How many hours will it take to apply 3 inches of water?

c. A heavy texture soil has a water intake rate of .10 inches per hour. How many hours will it take to apply 3 inches of water?
IRRIGATION
AG 150 - C

ASSIGNMENT SHEET #4--CONVERT UNITS OF WATER MEASUREMENT

Name ______________________________________ Score __________________________________

Using the conversion of units of flow from the information section, answer the following questions. When completed, return to instructor for evaluation.

a. A quarter-mile sprinkler line has 32 nozzles which deliver 5 gpm. What is your flow in cubic feet per second?

_______cubic feet/second

b. A flow of 2 c.f.s. equals how many gallons per minute?

_______gallons per minute

c. 1 c.f.s. flowing for 24 hours equals how many acre-inches and acre-feet?

_______acre-inches

_______acre-feet

d. 130 sprinkler nozzles are delivering 6.5 gpm. How many miner's inches are needed by the system?

_______miner's inches

e. With a flow of 2 c.f.s., how many acre-inches will be delivered in 48 hours?

_______acre-inches
IRRIGATION
AG 150 - C

ANSWERS TO ASSIGNMENT SHEETS

Assignment Sheet #1

a. TAM = 17.85 inches
   Amount to apply = 8.9 inches

b. TAM = 3.34 inches
   Amount to apply = 1.7 inches

c. TAM = 17.46 inches
   Amount to apply = 8.7 inches

Assignment Sheet #2

a. 61 days
b. 2 days
c. 3 days
d. 4 days

Assignment Sheet #3

a. 12 hours
b. 6 hours
c. 30 hours

Assignment Sheet #4

a. .36 c.f.s
b. 900 gpm
c. 1.983 acre-feet, 23.8 acre-inches
d. 94 miner's inches
e. 47.6 acre-inches

UNIT TEST

Name ______________________________________ Score __________________________________

1. Match terms associated with irrigation to the correct definitions. Write the correct numbers in the blanks.

   ____a. That part of the soil profile from which growing plants can utilize water and nutrients 1. Irrigation

   ____b. A measurement of difference in elevation from one point to another; it is generally referred to as a percent--the number of feet difference in elevation for 100 feet of horizontal distance 2. Tilth

   ____c. A device used for measuring water flow from a well or pipeline 3. Soil structure

   ____d. The combination or arrangement of soil particles (sand, silt, clay) into aggregates 4. Slope

   ____e. A vertical cross-section of the soil from the surface through all its horizons 5. Water table

   ____f. Chute placed in a stream or channel to measure the flow of water 6. Soil profile

   ____g. A series of parallel furrows commonly used in surface irrigation systems to direct the flow of water between seedbeds 7. Root zone

   ____h. To supply land with water by means of ditches, sprinklers or other system 8. Irrigation frequency

   ____i. The number of days between irrigations 9. Weir

   ____j. Channel for carrying water for drainage or irrigation of the soil 10. Measuring flume

   ____k. A name given a textural group based on the relative proportions of the soil separates (sand, silt, clay) 11. Flowmeter

   ____l. The level at which the soil is saturated with water; usually below the soil surface 12. Corrugate

   ____m. To supply land with water by means of ditches, sprinklers or other system 13. Ditch

   ____n. A series of parallel furrows commonly used in surface irrigation systems to direct the flow of water between seedbeds 14. Soil texture
150C - 41

_____m. An obstruction placed in a stream or channel diverting water through a device to measure the flow of water; types include rectangular, cipolleti and v-notch

_____n. The physical condition of soil as related to its ease of tillage and fitness as a seedbed

2. List three reasons for irrigating.
   a. __________________________________________
   b. __________________________________________
   c. __________________________________________

3. Select from the following list factors that affect water intake rates of soils. Write an "X" in the blank before each correct answer.
   _____a. Soil texture
   _____b. Subsurface texture
   _____c. Depth of soil profile
   _____d. Slope
   _____e. Soil structure
   _____f. Root zone
   _____g. Moisture content of soil profile

4. Calculate the total available moisture for barley, which has an effective root zone of 2.5 feet, grown on a sandy loam soil which has a water holding capacity of 1.67 inches/foot. Show all work.
   __________________________________________
   __________________________________________
   __________________________________________

5. Name three methods for estimating soil moisture in the crop root zone.
   a. __________________________________________
   b. __________________________________________
   c. __________________________________________
6. Calculate the days remaining until the next irrigation for alfalfa using the following information. Show all work.
   a. Effective root zone--4.0 feet
   b. Silt loam soil--Water holding capacity of 2.2 inches/foot
   c. Soil moisture monitored on July 10
      1. 1st foot--50% available moisture
      2. 2nd foot--60% available moisture
      3. 3rd foot--80% available moisture
      4. 4th foot--90% available moisture
      (Note: The root zone average is 70% available moisture.)
   d. Stress point for alfalfa--50%
   e. E_t rate = .27 inches/day
   f. Days until next irrigation ___________________________________________________

7. Name two units of volume measurement and two units of flow rate measurement of water.
   Volume measurement
   a. __________________________________________________________
   b. __________________________________________________________
   Flow rate measurement
   c. __________________________________________________________
   d. __________________________________________________________

8. Convert 5 cubic feet per second of water flow into:
   a. Gallons per minute __________________________________________
   b. Acre-feet per day __________________________________________
   a. ________________________________________________________________
   b. ________________________________________________________________
   c. ________________________________________________________________

10. List four types of irrigation systems.
    a. ________________________________________________________________
    b. ________________________________________________________________
    c. ________________________________________________________________
    d. ________________________________________________________________

11. Match the basic parts of a surface irrigation system to the correct description. Write the correct numbers in the blanks.

    ____a. Used for releasing the water from the head ditch or pipeline onto the land to be irrigated
         1. Water supply
ditch or pipeline onto the land to be irrigated
    ____b. The means by which water is delivered from the source to the field; it may be an open ditch or a pipeline
         2. Field supply line
         3. Head ditch or head pipeline
    ____c. Used for collecting excess water for reuse
         4. Turnouts
    ____d. The means by which water is made available from the field supply line to the different areas of the field
         5. Tailwater ditch
    ____e. Common sources include: farm ponds, rivers, canals and wells

12. Match the basic parts of a sprinkler irrigation system to the correct description. Write the correct numbers in the blanks.

    ____a. Delivers the water from the mainline pipe to the sprinklers
         1. Pumping unit
    ____b. Located at intervals along the lateral; break up water into various size drops and distribute over the ground
         2. Mainline pipe
         3. Lateral pipe
         4. Sprinklers
c. Takes water from its sources and makes it available under pressure to the system

d. Delivers the water from the pumping unit to the laterals

13. Select from the following list factors that affect the selection of an irrigation system. Write an "X" in the blank before each correct answer.

a. Soil texture  
b. Cost  
c. Average wind speed  
d. Labor required  
e. Soil profile  
f. Slope of field  
g. Shape of field  
h. Water tolerance of crop  
i. Maximum height of crop

14. Discuss costs involved with irrigation.

IRRIGATION

AG 150 - C

ANSWERS TO TEST

1. a. 7   f. 10   k. 14
   b. 4   g. 12   l. 5
   c. 11   h. 1   m. 9
   d. 3   i. 8   n. 2
   e. 6   j. 13

2. Provide water for crops in the right amount at the right time; Increase crop yield; Improve crop quality

3. a, d, e, g

4. 4.2 inches

5. Plant and field methods; Feel method; Tensiometers

6. 6.52 or 6 days until next irrigation

7. a.-b. Answer should include two of the following: Gallons; Acre-inches; Acre-feet
   c.-d. Answer should include two of the following: Gallons per minute; Cubic feet per second; Miner's inch

8. a. 2250 gpm
   b. 9.92 acre-feet
   c. 250 miner's inches

9. Weir; Flume; Flowmeter

10. Surface; Sprinkler; Trickle; Subsurface

11. a. 4   b. 2   c. 5   d. 3   e. 1

12. a. 3   b. 4   c. 1   d. 2

13. b, c, d, f, g, h, i

14. Discussion should include information from the following:

   Initial costs: Well (drilling, casing); Reservoir pump (line shaft, propeller, turbine, centrifugal); Power unit (electric, gasoline, diesel, natural gas or propane); Miscellaneous (electric switch, gas line, fuel tank, land plane, land development); Water pipe (underground or above ground); Pipe trailer; Sprinkler systems (hand-moved, tractor-moved, self-moved, self-propelled, permanent); Surface systems (land grading); Subsurface systems (ditches, pipelines); Land drainage, etc.

   Annual depreciation cost (based on): Initial cost of system; Interest; Taxes and insurance; Fixed charges (for example, stand-by charges for electricity); Loss of income from land taken out of production for water development; Life expectancy of system

   Annual operating cost: Fuel; Oil; Electricity; Equipment repair and maintenance; Reservoir and field maintenance; Water use charges; Labor
UNIT OBJECTIVE

After completion of this unit, students should be able to match terms and definitions and select from a list reasons for tillage. Students should also be able to identify equipment used in land preparation, determine when to plow and discuss the advantages of turning under crop residue. This knowledge will be demonstrated by completion of the unit test with a minimum of 85 percent accuracy.

SPECIFIC OBJECTIVES AND COMPETENCIES

After completion of this unit, the student should be able to:

1. Match terms associated with land preparation to the correct definitions.
2. Select reasons for tillage.
3. Name four characteristics of a good seedbed.
4. Classify tillage operations as primary or secondary.
5. Select factors that determine the time for primary tillage operation.
6. List two advantages of fall plowing and two advantages of spring plowing.
7. Select advantages of incorporating residue.
8. List two reasons for stubble mulching.
9. List two purposes of summer fallowing.
10. Select reasons to use minimum tillage.
LAND PREPARATION
AG 150 - D

SUGGESTED ACTIVITIES

I. Suggested activities for instructor

A. Order materials to supplement unit.

1. Literature
   b. *Tillage and Seedbed Preparation*, class activity packet; available from Agri-Farm Publications, Inc., 1019 Market Street, Gowrie, Iowa 50543; approximate cost $8.50; order no. 1117.

2. Filmstrips, slideshows, etc.
   b. *Tillage Machines*, 39 color slides; available from IAVIM, 208 Davidson Hall, Iowa State University, Ames, Iowa 50011; approximate cost $17.00; order no. 311.

B. Provide students with objective sheet and discuss.

C. Provide students with information sheet and discuss.

D. Take class on field trip to an implement dealer to see types of tillage equipment used in the community.

E. Have students collect pictures of tillage implements and bring to class.

F. Assign each student a report on a single piece of tillage equipment to be presented to the class.

G. Review and give test.

H. Reteach and retest if necessary.

II. Instructional materials

A. Objective sheet

B. Suggested activities
C. Information sheet

D. Test

E. Answers to test

III. Unit references

D. *Instructional Materials for Vocational Agriculture*, Teaching Materials Center, Agricultural Education Department, Texas A & M University, College Station, Texas.

LAND PREPARATION
AG 150 - D

INFORMATION SHEET

I. Terms and definitions

A. Tillage--Cultivation used to prepare or maintain a seedbed and/or control weeds

B. Cultivate--To break up the surface soil around plants in order to kill weeds, prevent crusting, preserve moisture and form corrugates for irrigation

C. Crop residue--Part of the crop that is left on top or in the soil after harvesting

D. Stubble mulching--Tillage beneath the stubble without covering all the crop residue; operated just below soil surface; used to kill weeds and encourage water infiltration and storage

E. Erosion--Removal of soil by wind and/or water

F. Land preparation--Complete process of preparing the soil after a crop is harvested until a new crop is planted

G. Summer fallow--Cropland left idle for one growing season; the soil is being cultivated to control weeds, release nitrogen and conserve moisture

H. Minimum tillage--Method of tillage in which certain operations are combined or eliminated to reduce the number of trips across the field

I. Moldboard plow--Primary tillage implement made up of a series of plow bottoms; it cuts, lifts and turns the furrow slice, burying the crop residue

J. Plow bottom--A three-sided wedge which inverts the furrow slice; each bottom is attached to a standard, which in turn is attached to the plow frame

K. Disk plow--Primary tillage implement made up of a series of disks; it cuts, lifts and rolls, but does not invert the furrow slice

L. Disk--Round, concave, rotating blades made in a variety of diameters; used for primary and secondary tillage operations

M. Chisel plow--Primary tillage implement made up of a series of chisels; used to break up hard, dry soils for water penetration where coverage of crop residue is not required

N. Chisel--A narrow, straight shank tool often with a point; each chisel is attached directly to the plow frame

O. Sweep--A "V"-shaped blade used on a chisel plow for stubble mulching; each sweep is attached directly to the plow frame
P. Standard--Supports for soil working tools of primary tillage implements, such as bottoms on plows

Q. Plow pan--Compacted layer restricting root and water movement; may form in some soils just below the tilled area after several years of primary tillage to the same depth

II. Reasons for tillage

A. Eliminate weeds
   (Note: It is important to control weeds as competitors against the cultivated crop for water, nutrients and sunlight. Chemicals are replacing tillage as a system of weed control.)

B. Improve soil condition for seed germination and plant growth
   (Note: The preparation of the seedbed must be timed so that the crop seed can be planted when environmental factors favor germination of the seed and the establishment of the seedling as a new plant.)

C. Aerate the soil

D. Destroy insects

E. Prepare land surface for irrigation

F. Aid in erosion control

G. Conserve moisture

H. Incorporate crop residue

III. Characteristics of a good seedbed

(Note: Seedbed preparation is determined by the crop to be planted.)

A. Free of trash and weeds

B. Firm
   (Note: The soil should be firm enough to prevent rapid drying and furnish a good medium for tiny root hairs. The seed must be in direct contact with the soil particles in order to receive adequate soil moisture.)

C. Loose and mellow
   (Note: Loose soil will permit better air circulation and seedling growth. It is necessary that plant roots expand easily through the soil.)
D. Minimum of plant disease

(Note: Crop rotation, fall plowing and the use of fungicides help eliminate plant disease problems.)

E. Minimum of insects

(Note: Crop rotation, use of insecticides, shredding of stalks and weeds and fall plowing will help free the soil of insects.)

F. Absorbs and holds water

(Note: Moisture is necessary for germination and plant development. Moisture dissolves the nutrients, making them available to the plant roots.)

IV. Classification of tillage operations

A. Primary tillage--Cuts, shatters and/or mixes the soil; may bury residue by inversion, mix it into the tilled layer or leave it basically undisturbed

(Note: Primary tillage is a more drastic, relatively deep operation, usually leaving the surface rough.)

1. Implements used for primary tillage
   a. Moldboard, disk and chisel plows
   b. Bedders and listers
   c. Subsoilers, chisels and rippers
   d. Rotary tillers

B. Secondary tillage--Provides additional pulverization of soil; levels and firms the soil, closes air pockets, helps to conserve moisture and kills weeds

(Note: Secondary tillage works the soil to a shallower depth than primary tillage, usually leaving the surface smooth.)

1. Implements used for secondary tillage
   a. Spring, spike and tine-tooth harrows
   b. Roller harrows and packers
   c. Rod weeders
   d. Field cultivators
   e. Disk tillers
V. Factors that determine time for primary tillage operation

A. Type of crop

(Note: Seedbed preparation is determined by the crop to be raised. In a minimum tillage operation, primary tillage may be eliminated, where in other cases it may be necessary every year.)

B. Weed problem

(Note: Weeds may tend to use the nitrates that may be lost to leaching in heavy rainfall areas; therefore, plowing may be delayed. Weed seeds should be allowed to germinate prior to tillage for weed control purposes.)

C. Erosion

(Note: Certain areas have heavy rainfall which cause a danger of water erosion. Late fall or winter tillage is considered unadvisable in such areas.)

D. Moisture

(Note: The amount of moisture in the soil can often delay primary tillage for seedbed preparation. If soils are too wet, the seedbed becomes seriously compacted if preparation is attempted. If a soil is too dry, it must be irrigated several days before preparation of the seedbed begins.)

VI. Advantages of fall and spring plowing

A. Fall

1. Incorporates residue to increase time for crop residue decomposition
2. Reduces spring workload; crops can be planted earlier
3. Helps hold moisture in low rainfall areas
4. Improves chance of forming a firm seedbed
5. Allows time for clods to crumble from freezing and thawing

B. Spring

1. Crop residue over winter aids in controlling wind erosion on sandy soil
2. Eliminates weeds which germinate in the spring
3. Standing residue catches snow

(Note: Fall plowing is usually preferred if the climate, soil and type of crop permits the practice. Experiments with corn, oats, barley and wheat in different parts of the United States show there is no production advantage between fall and spring plowing or seedbed preparation. Both systems of plowing produce about the same amount of grain per cropping season.)
VII. Advantages of incorporating crop residue

A. Increases organic matter in the soil
B. Returns plant nutrients to the soil
C. Increases microorganism activity, population and residue breakdown
D. Conserves moisture

(Note: The turning under of crop residue is classified as primary tillage. Residues left on or near the surface often reduce growth yields of the next crop. This has been attributed to toxic compounds leached from the residue or to microbial production of toxic compounds during decomposition. This condition is reduced if the crop residue is incorporated.)

VIII. Reasons for stubble mulching

A. Reduces wind and water erosion

(Note: Stubble-mulch plows cut off crop residue below the surface, leaving residue anchored to the surface, an advantage where limited quantities of residue are present and erosion is a problem.)

B. Increases water intake

IX. Purposes of summer fallowing

A. Conserves moisture
B. Controls weeds

(Note: This is the practice of allowing land to lie idle during a growing season to build up available moisture to produce a crop the following year. This is recommended in areas with less than 16 inches annual precipitation under dry land conditions.)

X. Reasons to use minimum tillage

A. Reduces number of trips across the field
B. Reduces costs for energy and labor
C. Conserves soil moisture
D. Reduces erosion
E. Lowers equipment investment
F. Permits earlier planting

G. Reduces soil compaction

(Note: Conservation tillage, mulch tillage, till-plant and no-till planting are types of minimum tillage systems. Weed control can be a problem with these systems, and the greater dependency on chemical weed control may offset savings in equipment and operating costs. If reduced-tillage cost savings exceed the value of possible yield reductions, net profit may be increased by accepting slightly lower yields.)
LAND PREPARATION

AG 150 - D

UNIT TEST

<table>
<thead>
<tr>
<th>Name</th>
<th>Score</th>
</tr>
</thead>
</table>

1. Match terms associated with land preparation to the correct definitions. Write the correct numbers in the blanks.

   ____ a. Complete process of preparing the soil after a crop is harvested until a new crop is planted

   1. Tillage

   ____ b. Primary tillage implement made up of a series of plow bottoms; it cuts, lifts and turns the furrow slice, burying the crop residue

   2. Cultivate

   ____ c. Part of the crop that is left on top or in the soil after harvesting

   3. Crop residue

   ____ d. Round, concave, rotating blades made in a variety of diameters; used for primary and secondary tillage operations

   4. Stubble mulching

   ____ e. A "V"-shaped blade used on a chisel plow for stubble mulching

   5. Erosion

   ____ f. Compacted layer restricting root and water movement; may form in some soils just below the tilled area after several years of primary tillage to the same depth

   6. Land preparation

   ____ g. Cultivation used to prepare or maintain a seedbed and/or control weeds

   7. Summer fallow

   ____ h. A three-sided wedge which inverts the furrow slice; each is attached to a standard, which in turn is attached to the plow frame

   8. Minimum tillage

   ____ i. To break up the surface soil around plants in order to kill weeds, prevent crusting, preserve moisture and form corrugates for irrigation

   9. Moldboard plow

   ____ j. Primary tillage implement used to break up hard, dry soils for water penetration where coverage of crop residue is not required

   10. Plow bottom

   ____ k. Supports for soil working tools of primary tillage implements, such as bottoms on plows

   11. Disk plow

   ____ l. Removal of soil by wind and/or water

   12. Disk

   ____ m. A "V"-shaped blade used on a chisel plow for stubble mulching

   13. Chisel plow

   ____ n. To break up the surface soil around plants in order to kill weeds, prevent crusting, preserve moisture and form corrugates for irrigation

   14. Chisel

   ____ o. Compacted layer restricting root and water movement; may form in some soils just below the tilled area after several years of primary tillage to the same depth

   15. Sweep

   ____ p. Cultivation used to prepare or maintain a seedbed and/or control weeds

   16. Standard

   ____ q. Primary tillage implement used to break up hard, dry soils for water penetration where coverage of crop residue is not required

   17. Plow pan
m. Method of tillage in which certain operations are combined or eliminated to reduce the number of trips across the field

n. A narrow, straight shank tool often with a point

o. Primary tillage implement that cuts, lifts and rolls, but does not invert the furrow slice

p. Cropland left idle for one growing season; the soil is being cultivated to control weeds, release nitrogen and conserve moisture

q. Tillage beneath the stubble without covering all the crop residue

2. Select from the following list reasons for tillage. Write an "X" in the blank before each correct answer.

   a. Eliminate weeds
   b. Aerate the soil
   c. Improve water table
   d. Aid in erosion control
   e. Prepare land for irrigation
   f. Destroy insects
   g. Decrease costs
   h. Conserve moisture
   i. Incorporate crop residue

3. Name four characteristics of a good seedbed.

   a. 
   b. 
   c. 
   d. 
4. Classify the following tillage operations. Write "P" in the blank for primary tillage operation or "S" for secondary tillage operation.

_____ a. Moldboard plow  
_____ b. Spring-tooth harrow  
_____ c. Roller harrow  
_____ d. Rotary tiller  
_____ e. Chisel plow  
_____ f. Rod weeder  
_____ g. Field cultivator  
_____ h. Disk plow  
_____ i. Spike-tooth harrow  
_____ j. Subsoiler

5. Select from the following list factors that determine the time for primary tillage operation. Write an "X" in the blank before each correct answer.

_____ a. Type of crop  
_____ b. Time of day  
_____ c. Month  
_____ d. Weed problem  
_____ e. Erosion  
_____ f. Moisture

6. List two advantages of fall plowing and two advantages of spring plowing.

Fall plowing
a. _______________________________________________________

b. _______________________________________________________

Spring plowing
a. _______________________________________________________

b. _______________________________________________________
7. Select from the following list advantages of incorporating residue. Write an "X" in the blank before each correct answer.

   _____ a. Conserves moisture
   _____ b. Reduces weed problems
   _____ c. Reduces erosion
   _____ d. Returns plant nutrients to the soil
   _____ e. Increases organic matter in the soil
   _____ f. Decreases microorganism levels in the soil

8. List two reasons for stubble mulching.
   a. ____________________________________________________________
   b. ____________________________________________________________

9. List two purposes of summer fallowing.
   a. ____________________________________________________________
   b. ____________________________________________________________

10. Select from the following list reasons to use minimum tillage. Write an "X" in the blank before each correct answer.

    _____ a. Reduces number of trips across the field
    _____ b. Reduces weed problems
    _____ c. Reduces erosion
    _____ d. Conserves soil moisture
    _____ e. Reduces plant disease problems
    _____ f. Reduces soil compaction
    _____ g. Reduces costs for energy and labor
    _____ h. Permits earlier planting
LAND PREPARATION

AG 150 - D

ANSWERS TO TEST

1. a. 6  g. 1  m. 8
   b. 9  h. 10  n. 14
   c. 3  i. 2  o. 11
   d. 12  j. 13  p. 7
   e. 15  k. 16  q. 4
   f. 17  l. 5

2. a, b, d, e, f, h, i

3. Answer should include four of the following:
   Free of trash and weeds; Firm; Loose and mellow; Minimum of plant disease; Minimum of insects; Absorbs and holds water

4. a. P  f. S
   b. S  g. S
   c. S  h. P
   d. P  i. S
   e. P  j. P

5. a, d, e, f

6. (Fall plowing) Answer should include two of the following:
   Incorporates residue to increase time for crop residue decomposition; Reduces spring workload; Crops can be planted earlier; Helps hold moisture in low rainfall areas; Improves chance of forming firm seedbed; Allows time for clods to crumble from freezing and thawing

(Spring plowing) Answer should include two of the following:
   Aids in controlling erosion on sandy soil; Eliminates weeds which germinate in the spring; Standing residue catches snow

7. a, d, e

8. Reduces wind and water erosion; Increases water intake

9. Conserves moisture; Controls weeds

10. a, c, d, f, g, h
UNIT OBJECTIVE

After completion of this unit, students should be able to list types of erosion and management practices that aid in conservation. Students should also be able to select from a list factors that determine cropping systems and conservation practices for reducing erosion. This knowledge will be demonstrated by completion of the unit test with a minimum of 85 percent accuracy.

SPECIFIC OBJECTIVES AND COMPETENCIES

After completion of this unit, the student should be able to:

1. Match terms associated with soil conservation practices to the correct definitions.
2. Name two types of erosion.
3. Match the four categories of water erosion to the correct description.
4. Select factors that influence soil erosion.
5. Select conservation practices for reducing wind erosion.
6. Select mechanical and cropping practices used in water erosion conservation.
7. Select factors that determine the type of cropping system to use.
8. Name two organizations involved with soil conservation.
SOIL CONSERVATION
AG 150 - E

SUGGESTED ACTIVITIES

I. Suggested activities for instructor

A. Order materials to supplement unit.

1. Literature

   b. *Soil and Water Conservation*, 250-page loose-leaf packet; available from IAVIM, 208 Davidson Hall, Iowa State University, Ames, Iowa 50011; approximate cost $12.50; order no. 229.

   c. The following Current Information Series publications are available from Agricultural Communications Center, Ag Publications Building, Building J40, Idaho Street, University of Idaho, Moscow, Idaho 83843-4196 (208-885-7982).

      *A Buried Drain Erosion and Sediment Loss Control System*, approximate cost $.35; order no. CIS 760.

      *Conservation Tillage for Control of Soil Loss by Water Erosion Under Dryland Crop Production*, approximate cost $.35; order no. CIS 824.

      *Crop Management Series: Effective Conservation Farming Systems*, approximate cost $.50; order no. PNW 275.

      *Five-Point Program: Divided Slope Farming for Soil Erosion Control Under Dryland Crop Production*, approximate cost $.35; order no. CIS 638.

      *Five-Point Program: Soil Erosion Control Under Dryland Crop Production*, approximate cost $.25; order no. CIS 483.

      *Furrow Erosion and Topsoil Losses*, approximate cost $.35; order no. CIS 586.

      *Furrow Erosion Reduces Crop Yields*, approximate cost $.35; order no. CIS 761.

      *Reducing Soil Losses by Sediment Retention*, approximate cost $.35; order no. CIS 696.

      *Reducing Soil Losses with Filter Strips*, approximate cost $.35; order no. CIS 587.
**Slot Mulching for Residue Management and Erosion Control**, approximate cost $.25; order no. PNW 231.

**Soil Erosion--How Much?**, approximate cost $.35; order no. CIS 563.

**The Chisel Planter--A Minimum Tillage System for Winter Wheat**, approximate cost $.35; order no. CIS 476.

**The Farmer and Erosion: Factors Influencing the Use of Control Practices**, approximate cost $1.00; order no. EXP 601.

2. Filmstrips, slideshows, etc.
   b. **Conservation Tillage**, 2 cassettes, 2 filmstrips and program guide; available from Teaching Aids, Inc., P. O. Box 1798, Costa Mesa, California 92626; approximate cost $70.00; order no. P1319.
   c. **Universal Soil Loss Equation**, filmstrip with script; available from IAVIM, 208 Davidson Hall, Iowa State University, Ames, Iowa 50011; approximate cost $15.00; order no. 336.

B. Make transparencies and necessary copies of materials.

C. Provide students with objective sheet and discuss.

D. Provide students with information and assignment sheets.

E. Discuss information and assignment sheets.

F. Take students on field trips to see types of erosion and cropping systems.

G. Invite person from SCS to address the class on combating erosion in your community.

H. Review and give test.

I. Reteach and retest if necessary.

SOIL CONSERVATION
AG 150 - E

INFORMATION SHEET

I. Terms and definitions

A. Erosion--Removal of soil by tillage, wind and/or water
B. Water outlet--Ditch which carries the excess water from farm
C. Terracing--Structure designed to slow down running water and control erosion on sloping land
D. Crop rotation--Rotation of crops on a field from one crop to another
E. Strip-cropping--Practice of growing soil-conserving and soil-depleting crops in alternate strips running perpendicular to the slope of the land or the direction of prevailing winds for the purpose of reducing erosion
F. Diversion ditch--Ditch which prevents erosion by diverting water around a field rather than across
G. Cover crop--Crop used to cover the soil surface to decrease erosion

II. Types of erosion (Transparencies 1, 2, 3)

A. Water erosion
B. Wind erosion
C. Tillage erosion

III. Categories of water erosion (Transparency 4)

A. Splash--Caused by the effect of falling raindrops
   (Note: A single raindrop may splash soil as far as 5 feet. A single beating one-inch rain may splash as much as one inch of soil depth by raindrop erosion. The weight of an acre of soil one inch deep is approximately 170 tons.)
B. Sheet--The removal of soil in a uniform layer from an entire surface area
   (Note: This type of erosion occurs continuously over periods of time, and the landowner may hardly be aware of its existence.)
C. Rill--Small channels are made by running water over the surface of the soil
   (Note: The tendency is for water to flow along the path of least resistance; therefore, it concentrates in low places to form channels. Continued flow in these channels develops minor rills. Number, size and pattern of rills depends on slope shape.)
D. Gully--An advanced stage of rill erosion; occurs when rills flow together into larger streams; cannot be crossed by equipment

IV. Factors influencing soil erosion (Transparency 5)

A. The nature of the soil
   1. Texture
   2. Structure
   3. Organic matter content

B. Climate
   (Note: Climate is the combined effect of wind, temperature and rainfall. When soil is frozen, the permeability of the soil is greatly reduced. If rainfall comes at this time, and other conditions are conducive, severe erosion will occur.)

C. Vegetative cover
   (Note: Vegetation will hold the soil particles together, cushion the impact of raindrops, and increase infiltration, all of which will decrease wind and water erosion.)

D. Slope and horizontal length
   (Note: The steepness and horizontal length of land will have a great effect on erosion. As water moves down a slope, it increases in velocity and carrying capacity. For example, doubling the percent of slope will increase the soil loss 2.5 times. Doubling the length of slope will increase soil loss 1.4 times.)

E. Management of the soil
   (Note: The way a soil has been managed will determine, to a large degree, the amount of erosion. The good farmer recognizes erosion as a problem and works to overcome it.)

V. Wind erosion conservation practices (Transparency 6)

A. Strip-cropping
B. Prevention of burning
C. Prevention of overgrazing
D. Moisture conservation
E. Emergency cover crops
F. Emergency tillage operations
G. Windbreak tree planting
H. Shelter belt of trees

VI. Water erosion conservation practices (Transparency 7)

A. Mechanical

(Note: Mechanical measures are designed to supplement the cropping program as well as control the movement of large quantities of rainfall on steeper slopes.)

1. Terracing
2. Diversions
3. Grass waterways
4. Land drainage
5. Land preparation
6. Construction of ponds and dams

B. Cropping

(Note: Cropping practices recommended are an attempt to give as much protection to the ground surface as possible while lands are being used, and also to increase the absorption of rainfall.)

1. Subsoiling or chiseling
2. Contour furrowing
3. Contour listing
4. Stubble mulching
5. Strip-cropping
6. Crop rotation

VII. Factors determining cropping system (Transparency 8)

(Note: Efficient use of the land should be the primary consideration of any good farmer. By efficient use is meant the use of land in such a way that maximum income and satisfaction is realized with minimum damage to the land. For example, crops planted on steep land may result in more loss due to damage to the land than is realized from the added income. The farmers should try to use the land in such a way that they will realize income while at the same time protect the land.)

A. Slope
B. Erodibility
C. Drainage
D. Moisture
E. Soil depth
F. Fertility
G. Economics

VIII. Organizations involved with soil conservation
A. Soil Conservation Service (SCS)
B. Agricultural Stabilization and Conservation Service
C. Local soil and water conservation districts
GENERALIZED SOIL EROSION MAP OF THE UNITED STATES

- **SLIGHT OR NONE**
- **MODERATE**
  - 25% - 75% of topsoil lost
- **SEVERE**
  - More than 75% of topsoil lost
SOIL DETACHMENT BY RAINDROPS

a raindrop may splash soil as far as 5 feet

a 1 inch rain may remove 1 inch of soil per acre (150 tons)
**Water Erosion**

**infiltration rate affects erosion due to runoff**

- massive soil structure
- granular soil structure
- runoff
Factors Influencing Soil Erosion

A. Nature of the soil
   1. Texture
   2. Structure
   3. Depth of soil
   4. Organic matter content

B. Climate

C. Vegetative cover

D. Slope and horizontal length

E. Management of the soil
WIND EROSION

A. STRIP CROPPING
B. PREVENTION OF BURNING
C. PREVENTION OF GRAZING
D. MOISTURE CONSERVATION
E. EMERGENCY COVER CROPS
F. EMERGENCY TILLAGE OPERATIONS
G. WINDBREAK TREE PLANTING
H. SHELTER BELT OF TREES

ASSIGNMENT SHEET #1--HOW DO YOU RATE AS AN FFA CONSERVATIONIST?

Name ______________________________________________  Score ______________________

Answer each of the questions below and on the following page. Turn in to the instructor. If the question applies to you or your farming operation, answer YES; if it does not apply to you, answer NO.

1. Are droughts on your farm less severe than they used to be?   ______   ______
2. Can you cultivate as soon after a rain as you once could?   ______   ______
3. Do the rains seem to soak into your soil faster and deeper than they once did?  ______   ______
4. Do streams flood less frequently?   ______   ______
5. Do your fields drain properly?   ______   ______
6. Are your crop yields increasing?   ______   ______
7. When you plow, does your soil seem darker in color than it was a few years ago?   ______   ______
8. Do you notice fewer clay spots in the fields when you plow?   ______   ______
9. Are gullies getting smaller in size and fewer in number?   ______   ______
10. Does your soil drift against the fences less now than it once did?   ______   ______
11. When you dig post holes, do you find plant roots all the way to the bottom of the holes?   ______   ______
12. After a beating rain, does the surface of your soil still appear open and porous like a sponge?  ______   ______
13. Is it becoming less difficult to prepare a good seedbed?   ______   ______
14. Does your soil crust over less now than it once did?   ______   ______
15. Do you spread manure on your land as fast as it is produced?   ______   ______
16. Do you grow a soil-building legume at least one year in three?   ______   ______
17. Do you plow under or incorporate all crop residues into your soil?  ______   ______
18. Do your crops grow better in dry weather than they once did?   ______   ______
19. Does it take less power to plow your fields than it did a few years ago?   __________  __________

20. Do you cultivate just often enough to control weeds?  __________  __________

21. Do you use a disc and chisel more now than you do a turning plow?  __________  __________

22. Do you follow the recommended planting dates for all farm crops?  __________  __________

23. Do you follow a recommended crop rotation plan for all fields?  __________  __________

24. Do you plant the highest yielding varieties of crops?  __________  __________

25. Does your cropping system produce the most possible forage for your livestock?  __________  __________

26. Are your yields per acre as high as any in your neighborhood?  __________  __________

27. Have you increased the productivity of all of your fields and pastures?  __________  __________

28. Do you use as much limestone as any farmer on similar land in the neighborhood?  __________  __________

29. Do you fertilize your fields and pastures as much as do any of your neighbors?  __________  __________

30. Do you graze the right number of livestock on your range and pasture land?  __________  __________

31. Are your livestock healthy?  __________  __________

32. Do you have a home garden as good as any in your neighborhood?  __________  __________

33. Have you had your soil tested on all gardens, fields and pastures within the past three years?  __________  __________

**Your rating as an FFA conservationist:**

Total answers which are YES ______  NO ______

I am

* Good..................................(22-33 YES answers)
* Fair.................................(11-21 YES answers)
* Poor...............................( 0-10 YES answers)

*The contents of this assignment sheet have been reprinted by permission from *Our Soils and Their Management* by Roy L. Donahue, published by The Interstate Printers and Publishers, Inc., Danville, Illinois.*
ASSIGNMENT SHEET #2--CONSERVING SOIL CROSSWORD PUZZLE

Name ______________________________________  Score ______________________

ACROSS

1. The wearing away of the soil by forces of water and wind.
2. Removal of soil in a uniform layer.
3. A crop grown to cover and protect the soil for a certain part of the year.
4. Advanced stage of rill erosion.
5. The wearing away of the soil by forces which are natural and without interference by man is called _________.
9. Practice of planting strips of row crops with strips of meadow, small grains, etc. to slow down water.
10. Grassed ditch-like structure to carry excess water.
11. Soils with high content have increased absorption capacity.
15. Structure to hold or impound water.

DOWN

6. Erosion is characterized by many small channels cut in to the soil by running water.
11. Farming around the slopes rather than up and down.
12. Alternating row crops with sod type crops to increase organic matter and reduce annual sod loss.
13. Office will give assistance free of charge for conservation planning.
14. A good ground cover (decreases, increases) water intake.
15. Protects the soil's surface during parts of the season that crops are not grown.
17. The shape of the ground surface, as determined by major features such as hills, mountains, or plains.

UNIT TEST

Name ________________________________  Score ______________________

1. Match terms associated with soil conservation practices to the correct definitions. Write the correct numbers in the blanks.

   _____a. Rotation of crops on a field from one crop to another  1. Erosion
   _____b. Ditch which prevents erosion by diverting water around a field rather than across  2. Water outlet
   _____c. Removal of soil by tillage, wind and/or water  3. Terracing
   _____d. Structure designed to slow down running water and control erosion on sloping land  4. Crop rotation
   _____e. Crop used to cover the soil surface to decrease erosion  5. Strip-cropping
   _____f. Practice of growing soil-conserving and soil-depleting crops in alternate strips for the purpose of reducing erosion  6. Diversion ditch
   _____g. Ditch which carries excess water from farm  7. Cover crop

2. Name two types of erosion.

   a. __________________________________________________________________________
   b. __________________________________________________________________________

3. Match the categories of water erosion to the correct description. Write the correct numbers in the blanks.

   _____a. Small channels are made by running water over the surface of the soil  1. Splash
   _____b. The removal of soil in a uniform layer from an entire surface area  2. Sheet
   _____c. Caused by the effect of falling raindrops  3. Rill
   _____d. An advanced stage of rill erosion; occurs when rills flow together into larger streams; cannot be crossed by equipment  4. Gully
4. Select from the following list factors that influence soil erosion. Write an "X" in the blank before each correct answer.

   a. Soil texture
   b. Organic matter content
   c. Slope of field
   d. Soil depth
   e. Vegetative cover
   f. Management practices used
   g. Frozen soil
   h. Horizontal length of land
   i. Root zone

5. Select from the following list conservation practices for reducing wind erosion. Write an "X" in the blank before each correct answer.

   a. Strip-cropping
   b. Terracing
   c. Construction of ponds and dams
   d. Prevention of overgrazing
   e. Emergency cover crops
   f. Prevention of burning
   g. Crop rotation
   h. Grass waterways
   i. Moisture conservation

6. Select from the following list mechanical and cropping practices used in water erosion conservation. Write an "X" in the blank before each correct answer.

   a. Construction of ponds and dams
   b. Stubble mulching
   c. Grass waterways
   d. Moisture conservation
   e. Windbreak tree planting
7. Select from the following list factors that determine the type of cropping system to use. Write an "X" in the blank before each correct answer.

   ___ a. Soil profile
   ___ b. Erodibility
   ___ c. Drainage
   ___ d. Field size
   ___ e. Moisture
   ___ f. Soil depth
   ___ g. Fertility
   ___ h. Nitrogen content
   ___ i. Economics

8. Name two organizations involved with soil conservation.

   a. ____________________________________________
   b. ____________________________________________
SOIL CONSERVATION
AG 150 - E

ANSWERS TO TEST

1. a. 4  e. 7  
b. 6  f. 5  
c. 1  g. 2  
d. 3

2. Answer should include two of the following: Water; Wind; Tillage

3. a. 3  b. 2  c. 1  d. 4

4. a, b, c, e, f, g, h

5. a, d, e, f, i

6. a, b, c, f, g, h, i, j

7. b, c, e, f, g, i

8. Answer should include two of the following:

Soil Conservation Service; Agricultural Stabilization and Conservation Service; Local soil and water conservation districts
UNIT OBJECTIVE

After completion of this unit, students should be able to judge land, recommend land treatments and complete the scorecard for land judging or homesite evaluation. This knowledge will be demonstrated by completion of the unit test with a minimum of 85 percent accuracy.

SPECIFIC OBJECTIVES AND COMPETENCIES

After completion of this unit, the student should be able to:

1. Match terms associated with land judging to the correct definitions.
2. List three reasons for judging land.
3. Select factors considered in determining land capability class.
4. Name the three major groups of soil in relation to texture.
5. Discuss the means of determining soil texture by touch.
6. Match the different variations of permeability, depth, slope, erosion, surface runoff, drainage and climate to the identifying characteristics of each.
7. Match the land capability class to the correct description.
8. Select, when given six land factors, the best land class possible for the specified field.
9. Select the recommended vegetative land treatments when given the land capability class.
10. Select the recommended mechanical land treatments when given the land capability class.
11. Select the correct fertilizer and soil amendments needed from soil test information provided.
12. Select factors considered in homesite evaluation.
13. Match the variations of permeability, slope, erosion, runoff, shrink-swell, water table and flooding to the correct definitions for homesite evaluation.
14. Select, when given land factors, the degree of limitation for foundations without basement; lawns, shrubs and gardens; septic systems; and lagoon sewage systems.
15. Demonstrate the ability to:
   a. Complete a land judging scorecard when given the characteristics of a field.
   b. Complete a homesite evaluation scorecard when given the characteristics of the site.
LAND EVALUATION AND USE CLASSIFICATION

AG 150 - F

SUGGESTED ACTIVITIES

I. Suggested activities for instructor

A. Order materials to supplement unit.

1. Literature

   a. *Idaho Soils Atlas*, an illustrated manual showing 54 soils throughout the state of Idaho, contact local SCS person for information on obtaining a copy.

2. Filmstrips, slideshows, etc.

   a. *Land Judging Slides*, set of 72 slides with script; the slides give a complete overview of land judging school and contest rules; available from CIMC, Oklahoma State Department of Voc-Tech Educ., 1500 W. 7th Ave., Stillwater, Oklahoma 74074; approximate cost $22.00.

   b. *Soil and Land Judging Contest Set Up and Procedures*, Program #476, 9 1/2 minutes; shows how to set up and conduct a soil judging contest according to the Idaho land judging program; one available in each University of Idaho District Extension Office.

B. Make transparencies and necessary copies of materials.

C. Provide students with objective sheet and discuss.

D. Provide students with information and assignment sheets and discuss.

E. Have students conduct laboratory experiments on soil permeability, slope, runoff and erosion.

F. Conduct field trip to judge a previously prepared land site.

G. Conduct a county soil-judging contest involving the FFA and 4-H members of the county.
H. Review and give test.
I. Reteach and retest if necessary.

II. Instructional materials
   A. Objective sheet
   B. Suggested activities
   C. Information sheet
   D. Transparency masters
      1. TM 1--Factors Determining Land Capability Class
      2. TM 2--Determining Soil Texture

2. AS 2--Complete Homesite Evaluation Land Judging Scorecard

F. Answers to assignment sheets

G. Test

H. Answers to test

III. Unit references

C. *Instructional Materials for Vocational Agriculture*, Teaching Materials Center, Agriculture Education Department, Texas A & M University, College Station, Texas.

I. Terms and definitions

A. Surface texture--Texture of the surface soil or "A" horizon; proportion of sand, silt and clay that makes up the surface soil.

B. Sand--(0.05 to 2 mm) The gritty material which you can feel when you rub the soil with your fingers; individual grains can be seen or felt.

C. Silt--(0.002 to 0.05 mm) The floury material which you can feel when you rub the soil with your finger; it is not gritty and not sticky when wet.

D. Clay--(less than 0.002 mm) Forms lumps or clods when dry and is plastic and sticky when wet; when pinched out between the thumb and finger will form a long flexible "ribbon".

E. Soil pores--Total space not occupied by soil particles in a bulk volume of soil.

F. Hard pan--A hardened soil layer in the lower "A" or deeper horizon; not readily penetrated by plant roots or water.

G. Bulk density--The weight of dry soil per unit bulk volume, for example: grams per cm³ or pound per cubic foot.

H. Soil structure--Way that individual soil particles are grouped together to form clusters of particles.

I. Topsoil or "A" horizon--Surface, dark-colored upper layer of natural soil; zone in which seeds are planted and cultivated; main storehouse for minerals and moisture.

J. Subsoil--Layer found just below the topsoil; the "B" horizon; also a storehouse for moisture and minerals.

K. Permeability--Rate at which air and water move through the soil.

L. Soil depth--Total thickness of soil layers readily penetrated by roots.

M. Slope--A measurement of difference in elevation from one point to another; it is generally referred to as a percent--the number of feet difference in elevation for 100 feet of horizontal distance.

N. Erosion--Loss of soil by the actions of tillage, wind and/or water.

O. Surface runoff--Relative rate water is removed by flow over the soil surface.

P. Drainage--The ability of a soil to permit the downward flow of excess water to allow good aeration.
Q. Climate--Amount of annual precipitation and the length of the growing season; affects crops that can be grown and crop yields

R. Land capability class--Grouping of different soils according to productive capacity, use, management and conservation treatment required to minimize erosion

S. Soil conserving crops--Crops that prevent or retard erosion and tend to maintain rather than deplete soil organic matter

(Note: Close seeded crops are generally regarded as soil conserving crops.)

T. Soil improving crops--Crops that improve or replenish rather than deplete soil organic matter; improve soil structure and tilth

(Note: Grasses and legumes are such crops.)

II. Reasons for judging land

A. Aids in understanding the importance of basic soil differences as they affect crop production and erosion

B. Helps to determine management practices important to proper use of soil and water

C. Develops understanding of different soil and water conservation practices

D. Aids in understanding the influence of land features on production and land protection

E. Aids in selecting a farm for purchase or making maximum use of land

III. Factors considered in determining land capability class (Transparency 1)

A. Surface texture

B. Permeability

C. Depth of soil

D. Slope

E. Erosion

(Note: This includes wind and water.)

F. Surface runoff

G. Drainage

H. Climate
IV. Major groups of soil in relation to texture

A. Sandy soils--Includes coarse textured, very sandy soils
B. Loamy soils--Includes moderately coarse, medium textured and moderately fine textured soils
C. Clayey soils--Includes fine textured soils

(Note: Refer to textural triangle for specific textural classes that fall into these groups.)

V. Determining soil texture by touch (Transparency 2)

(Note: Soil texture can be determined by touch with the aid of water by working or feeling the soil between fingers and thumb. Refer to AG 150-A--Elementary Study of Soils, Laboratory Exercise #2 for additional information.)

A. Sandy soils--When rubbed between fingers this soil has a rough, gritty feeling; individual grains can be seen or felt
B. Loamy soils--When rubbed between the fingers this soil has a touch of velvet or the feel of wheat flour; it is not gritty and not sticky when wet
C. Clayey soils--Forms very hard lumps or clods when dry and is sticky when wet; when pinched out between the thumb and finger will form a long flexible "ribbon"

VI. Important soil and land characteristics

A. Permeability of subsoil (Transparencies 3, 4)
   1. Very slow--Less than 0.06 in/hr; soils that have dense heavy clay or clay pan subsoil
   2. Slow--0.06 to 0.2 in/hr; soils that have crumbly, clayey subsoil
   3. Moderate--0.2 to 6.0 in/hr; soils that have highly granular, clay loam subsoil
   4. Rapid--over 6.0 in/hr; soils that have sandy subsoils

B. Depth of soil (Transparency 5)

(Note: Depth of soil includes the total thickness of the soil layers readily penetrated by plant roots, air and water. A restrictive layer may be dense clay, hardpan or bedrock.)
   1. Very shallow--Less than 10 inches deep
   2. Shallow--10 to 20 inches deep
   3. Moderately deep--20 to 40 inches deep
4. Deep—40 to 60 inches deep
5. Very deep—over 60 inches deep

C. Slope  (Transparency 6)

(Note: This is one of the most important factors in land classification. Runoff increases with slope and that in turn increases the erosion hazard for most uses of the land. The two possible slope groupings are for (1) dry cropland and (2) irrigated cropland. For irrigated cropland consider only for surface irrigation. Sprinkler irrigation on cropland reduces the erodibility of a soil due to slope and would need another grouping of percentages to indicate severity of slope. Slope groupings will vary with use, area, soil type, etc.)

<table>
<thead>
<tr>
<th>Slope Description</th>
<th>Dry Cropland</th>
<th>Irrigated Cropland</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nearly level</td>
<td>0 to 3%</td>
<td>0 to 1%</td>
</tr>
<tr>
<td>Gently sloping</td>
<td>3 to 8%</td>
<td>1 to 3%</td>
</tr>
<tr>
<td>Moderately sloping</td>
<td>8 to 12%</td>
<td>3 to 5%</td>
</tr>
<tr>
<td>Strongly sloping</td>
<td>12 to 20%</td>
<td>5 to 8%</td>
</tr>
<tr>
<td>Steep</td>
<td>20 to 45%</td>
<td>8 to 12%</td>
</tr>
<tr>
<td>Very steep</td>
<td>more than 45%</td>
<td>more than 12%</td>
</tr>
</tbody>
</table>

D. Erosion  (Transparency 7)

(Note: Evaluation of the site for land judging will be based on past erosion. Original topsoil depth can be found on the site placard and compared to present depth of topsoil to calculate the percent lost. The present topsoil can be determined by dark color, presence of organic matter and soil structure.)

1. None to slight—Less than 25% of the surface soil is removed with no gullies and/or little deposition by wind and water
2. Moderate—25% to 75% of the surface soil removed with or without gullies and/or moderate deposition by wind and water
3. Severe—More than 75% of the surface soil removed with occasional uncrossable gullies and/or severe accumulation or blowouts by wind

E. Surface runoff  (Transparency 8)

(Note: Surface runoff occurs from a combination of natural factors including land slope and water infiltration rate of the soils. Runoff causes erosion—loss of water, loss of soil, loss of nutrients. Lack of runoff causes ponding and excess water in the soil profile.)

1. Rapid—Surface water flows rapidly; fields with slopes of 3% and above (except rapidly permeable soils) would go in this category
2. Moderate--Normal runoff from soils with slopes of 1 to 3% (except rapidly permeable soils)

3. Slow--Surface water flows away slowly; surplus water on clayey soils is an occasional problem; can include nearly level areas (less than 1% slopes) with moderately permeable subsoil

4. Very slow--Surface water flows away very slowly; includes soils on nearly level slopes (less than 1%) with clayey surface texture or sandy texture soils with rapidly permeable subsoil

F. Drainage

(Note: Drainage is the ability of the subsoil to permit the downward flow of excess water to allow good aeration.)

1. Excessive--Excess amounts drain away quickly causing drought conditions; includes only rapidly permeable soils

2. Good--Saturation with water is limited to only a few days; plant roots are not injured

3. Somewhat poor--Saturation with water in root zone is limited to 1 or 2 weeks; this will injure plant roots

4. Poor--Saturation with water in root zone for more than two weeks; this will severely injure plant roots so that crop yield is appreciably reduced or the crop is destroyed

G. Climate

(Note: A short growing season and low natural precipitation are limitations in many parts of Idaho. Low natural precipitation is not a factor when irrigation water is available. Class I land is determined by the ability to produce mature corn for grain.)

1. Good--More than 140 frost-free days along with more than 10 inches of average annual precipitation. If less than 10 inches of annual precipitation occurs, irrigation water must be available

2. Fair--100 to 140 frost-free days along with more than 10 inches of average annual precipitation. If less than 10 inches of average annual precipitation occurs, irrigation water must be available

3. Poor--Less than 100 frost-free days or less than 10 inches of average annual precipitation with irrigation water unavailable
VII. Land capability classes (Transparencies 9, 10, 11, 12)

A. Land suited for cultivation

1. Class I--Soils having few limitations that restrict their use
2. Class II--Soils having some limitations that reduce the choice of plants; require moderate conservation practices
3. Class III--Soils having severe limitations that reduce the choice of plants or require special conservation practices, or both
4. Class IV--Soils having very severe limitations that restrict the choice of plants, require very careful management, special conservation or all of the above

B. Land not suited for cultivation

1. Class V--Soils having little or no erosion hazards, but having other limitations that are impractical to remove that limit their use largely to pasture, range, woodland or wildlife food and cover; these include areas with very poor drainage with wet, poorly drained profiles or frequent flood areas
2. Class VI--Soils having severe limitations that make them generally unsuited for cultivation and limit their use largely to pasture, range, woodland or wildlife food and cover
3. Class VII--Soils having very severe limitations that make them unsuited for cultivation and restrict their use largely to grazing, woodland or wildlife habitat

C. Land not suited for cultivation, grazing or forestry

1. Class VIII--Soils and land forms having limitations that preclude their use for commercial plant production and restrict their use to wildlife, recreation, water supply or scenic purposes

### Vegetative land treatments (Transparency 13)

#### A. Land suited for cultivation (class I - IV)

1. Use soil conserving and/or improving crops

   (Note: Conservation cropping systems include the use of rotations that contain grasses and legumes as well as sequences in which the desired benefits are achieved without use of such crops.)

   a. Not necessary--Applicable to class I

   b. Every fourth or fifth year--Applicable to class II
c. Every third or fourth year--Applicable to class III

d. Every second or third year--Applicable to class IV

2. Crop residue use

(Note: Use of crop residues left in cultivated fields helps to prevent erosion and improve the soil by adding organic matter; applies to classes I, II, III, IV.)

3. Weed control

(Note: Weed control should be used any time there is an indication of a weed problem. One or more weeds within the boundary of the field will be considered to be a weed problem; could apply to all land classes.)

4. Strip cropping

(Note: Only applies to non-irrigation land classes III and IV.)

5. Brush and tree control

(Note: This practice should not be used when brush material can be controlled by normal farm plowing; applies only to land classes I, II, III, IV.)

B. Land not suited for cultivation (class V - VII)

1. Grasses and legumes

(Note: Used for all class V, VI and VII land except where tree plantings are made.)

2. Pasture, range, hay management

3. Tree planting

4. Woodland harvest cutting

5. Wildlife, recreation and watershed

(Note: Also includes class VIII.)

X. Mechanical land treatments (class I - IV) (Transparency 14)

A. Irrigated land only

1. Land leveling and smoothing

(Note: This does not include simple float, harrow or land plane.)

2. Irrigation water management

3. Water control structures
B. Dryland only
   1. Diversion or terrace
   2. Grass waterway
   3. Contour farming

C. Both irrigated and dryland
   1. Subsurface drainage system
      (Note: Used on somewhat poorly and poorly drained areas.)
   2. Minimum tillage

XI. Fertilizers and soil amendments

(Note: No set limits on lime, gypsum or fertility requirements will fit all areas and all crops. This is to acquaint land judges with present-day terminology and to have some knowledge about soil fertility requirements for Idaho crops and soils. Soil test information will be provided at each site.)

A. Nitrogen--Add when values are less than 40 ppm

B. Phosphorus--Add when values are less than 6 ppm on acid soils, and 10 ppm on alkaline soils

C. Potassium--Add when values are less than 80 ppm on acid soils, and 150 ppm on alkaline soils

D. Micronutrients--Add when zinc levels are below 0.6 ppm
   (Note: Zinc is the only micronutrient for which a low level has been established for Idaho soils.)

E. Lime--Add when pH values for a field are less than 6.3

F. Gypsum--Add when pH values for a field are greater than 8.5

G. Organic matter--Add when shown as available

XII. Factors considered in homesite evaluation

A. Surface texture

B. Permeability

C. Soil depth

D. Slope

E. Erosion
F. Surface runoff
G. Shrink-swell (heaviest layer)
H. Water table (permanent or temporary)
I. Flooding

XIII. Important soil and land characteristics for homesite evaluation

(Note: Many of the soil characteristics important to land judging are also important to homesite evaluation. While many of the characteristics are the same, different separations are made within the class, for example: five categories for slope instead of six, etc. Only those classes with different numbers of categories will be covered in this section.)

A. Permeability
   1. Slow--Less than 0.2 inches per hour
   2. Moderate--0.2 to 6.0 inches per hour
   3. Rapid--Greater than 6.0 inches per hour

B. Slope
   1. Nearly level--0 to 0.5 percent
   2. Gently sloping--0.5 to 5 percent
   3. Moderately sloping--5 to 8 percent
   4. Strongly sloping--8 to 15 percent
   5. Very strongly sloping--Over 15 percent

(Note: Broader and different slope ranges apply to urban use consideration than normally apply to consideration for agricultural land.)

C. Erosion
   1. None to slight and moderate--Less than 75% of the surface removed
   2. Severe--Greater than 75% of the surface soil removed; require minor modifications
   3. Very severe--Greater than 75% of the surface soils removed, usually severely gullied; require extensive modification
D. Surface runoff
1. Slow--Occurs on nearly level areas (less than 0.5%) and deep sands
2. Moderate--Occurs on slopes of 0.5 to 5%
3. Rapid--Occurs on slopes greater than 5%, except on deep sands

E. Shrink-swell
1. Low--Sands, loams and fine sandy loams
2. Moderate--Silt loams, clay loams and silty clay loams
3. High--Silty clay and clays

F. Water table
1. Deep--None evident above 72 inches
2. Moderately deep--Temporary or permanent water table present at depth of 48 to 72 inches
3. Shallow--Temporary or permanent water table at depths less than 48 inches
(Note: Unless obvious, water table depth or seasonal fluctuations are given on a placard at site.)

G. Flooding
1. Slight--No flooding
2. Severe--Occasional flooding; less frequent than one year in five
3. Very severe--Frequent flooding; more frequent than one year in five

Soil Permeability

"B" HORIZON (SUBSOIL)

FACTORS DETERMINING PERMEABILITY CLASSIFICATION ARE:
SIZE - SHAPE - STRENGTH - ARRANGEMENT OF SOIL AGGREGATES

GRANULAR

SINGLE GRAIN

RAPID

PRISMATIC

BLOCKY

MODERATE

MASSIVE

PLATY

SLOW OR VERY SLOW
Depth of Soil...

DETERMINED BY TOTAL THICKNESS
OF SOIL LAYERS READILY PENETRATED
BY PLANT ROOTS

Deep
40" to 60"

Moderately Deep
20" to 40"

Shallow
10" to 20"

Very shallow
less than 10"
SLOPE

DETERMINED BY THE NUMBER OF FEET FALL IN EACH 100 FEET

SLOPE RANGES

NEARLY LEVEL

1-3 FT.

LESS THAN 1 FT. FALL

GENTLY SLOPING

3-5 FT.

3-5 FT.

MODERATELY SLOPING

5-8 FT.

STRONGLY SLOPING

8-12 FT.

STEEP

OVER 12 FT.

GROUND LINE
Water & Wind Erosion

In determining erosion classification, observe thickness of remaining topsoil and compare with original thickness as furnished from information sheet.

None to slight — less than 25% (with no gullies)
Moderate — 25% to 75% (without frequent uncrossable gullies)
Severe — 75% or more (with or without occasional uncrossable gullies)
Very severe — 75% or more (with frequent uncrossable gullies and/or severe accumulations by wind)
Surface Runoff

- LAND SLOPE AFFECTS RUNOFF

- WATER INFILTRATION RATE AFFECTS RUNOFF

- RAPID - 3% AND ABOVE SLOPE EXCEPT RAPIDLY PERMEABLE SOILS
- MODERATE - 1% TO 3% SLOPE EXCEPT RAPIDLY PERMEABLE SOILS
- SLOW - 0 TO 1% SLOPE AND PERMEABILITY OTHER THAN RAPID
- VERY SLOW - NEARLY LEVEL SLOPES GENERALLY HAVING RAPID PERMEABILITIES
LAND CAPABILITY CLASSES

SUITABLE FOR CULTIVATION

I REQUIRES GOOD SOIL MANAGEMENT PRACTICES ONLY

II MODERATE CONSERVATION PRACTICES NECESSARY

III INTENSIVE CONSERVATION PRACTICES NECESSARY

IV PERENNIAL VEGETATION · INFREQUENT CULTIVATION

UNSUITABLE FOR CULTIVATION; BUT SUITABLE FOR GRAZING, FORESTRY, AND WILDLIFE FOOD AND COVER

V LIMITED RESTRICTIONS IN USE, USUALLY POORLY DRAINED OR SUBJECT TO OVERFLOW

VI MODERATE RESTRICTIONS IN USE

VII SEVERE RESTRICTIONS

UNSUITABLE FOR CULTIVATION, GRAZING, OR FORESTRY

VIII EXTREME RESTRICTIONS FOR RECREATION, WILDLIFE, WATER SUPPLY, OR AESTHETIC PURPOSES
Major Factors
That Keep Area Out of Class 1

☐ 1. Texture
☐ 2. Permeability
☐ 3. Depth
☐ 4. Slope
☐ 5. Erosion
☐ 6. Runoff
☐ 7. Drainage
☐ 8. Climate
☐ 9. None

# Idaho Land Judging Scorecard

(Indicate answer by an X in the box)

## PART I — LAND CLASS FACTORS

### A. SURFACE TEXTURE
- 1. Sandy soils
- 2. Loamy soils
- 3. Clayey soils

### B. PERMEABILITY
- 1. Very slow
- 2. Slow
- 3. Moderate
- 4. Rapid

### C. DEPTH, SURFACE AND SUBSOIL
- 1. Very shallow — less than 10"
- 2. Shallow — 10 to 20"
- 3. Moderately deep — 20 to 40"
- 4. Deep — 40 to 60"
- 5. Very deep — over 60"

### D. SLOPE
- 1. Nearly level
- 2. Gently sloping
- 3. Moderately sloping
- 4. Strongly sloping
- 5. Steep
- 6. Very steep

### E. EROSION — WIND AND WATER
- 1. None to slight — less than 25% lost
- 2. Moderate — 25 to 75% lost
- 3. Severe — over 75% lost

### F. SURFACE RUNOFF
- 1. Rapid
- 2. Moderate
- 3. Slow
- 4. Very slow

### G. DRAINAGE
- 1. Excessive
- 2. Good
- 3. Somewhat poor
- 4. Poor

### H. CLIMATE
- 1. Good
- 2. Fair
- 3. Poor

### I. MAJOR FACTORS
- Any which keep area out of Class I
- 1. Texture
- 2. Permeability
- 3. Depth
- 4. Slope
- 5. Erosion
- 6. Surface runoff
- 7. Drainage
- 8. Climate
- 9. None

### J. LAND CAPABILITY CLASS
- 1. Class I
- 2. Class II
- 3. Class III
- 4. Class IV
- 5. Class V
- 6. Class VI
- 7. Class VII
- 8. Class VIII

## PART II — RECOMMENDED LAND TREATMENTS

### K. VEGETATIVE
Use soil conserving and/or improving crops:
- 1. Not necessary — Class I
- 2. Every 4-5th year — Class II
- 3. Every 3-4th year — Class III
- 4. Every 2-3rd year — Class IV
- 5. Crop residue use
- 6. Weed control
- 7. Strip cropping
- 8. Brush and tree control
- 9. Grasses and legumes
- 10. Pasture, range, hay management
- 11. Tree planting
- 12. Woodland harvest cutting
- 13. Wildlife, recreation and watershed

### L. MECHANICAL

#### Irrigated Only
- 14. Land leveling and smoothing
- 15. Irrigation water management
- 16. Water control structures

#### Dryland Only
- 17. Diversion or terrace
- 18. Contour farming
- 19. Grass waterway

#### Both Dryland and Irrigated
- 20. Subsurface drainage system
- 21. Minimum tillage

### M. FERTILIZERS AND SOIL AMENDMENTS
- 22. Nitrogen (N)
- 23. Phosphorus (P)
- 24. Potassium (K)
- 25. Micronutrients
- 26. Lime
- 27. Gypsum
- 28. Organic matter
- 29. Fertilizer or amendments not needed

ASSIGNMENT SHEET #1--COMPLETE IDAHO LAND JUDGING SCORECARD

Name ____________________________________ Score ____________________________

Apply the following land class factors and field conditions to the judging scorecard:

1. Texture--Feel of wheat flour
2. Permeability--Granular, clay loam
3. Depth--26 inches
4. Slope--3 1/2 foot fall in each 100 feet
5. Erosion--30% of topsoil removed, no gullies
6. Drainage--Root zone saturated with water limited to 1 week
7. Climate--120 days, irrigation water available
8. Soil test results
   a. pH--6.0
   b. N--25 ppm
   c. P--8 ppm
   d. K--250 ppm
   e. Zn--0.8 ppm

ASSIGNMENT SHEET #2--COMPLETE IDAHO HOMESITE EVALUATION
LAND JUDGING SCORECARD

Name ______________________________________ Score ____________________________

Apply the following homesite soil factors and conditions to the judging scorecard:

1. Texture--Moderately gritty
2. Permeability--Soft blocky, sandy loam
3. Soil depth--55 inches
4. Slope--2 foot fall in each 100 feet
5. Erosion--60% of topsoil removed, no gullies
6. Water table--None evident above 72 inches
7. Flooding--No flooding

UNIT TEST

Name ____________________________________ Score ____________________________

1. Match terms associated with land judging to the correct definition. Write the correct numbers in the blanks.

   ____ a. Relative rate water is removed by flow over the soil surface 1. Surface texture
   ____ b. Total thickness of soil layers readily penetrated by roots 2. Sand
   ____ c. Crops that prevent or retard erosion and tend to maintain rather than deplete soil organic matter 3. Silt
   ____ d. The number of feet difference in elevation for 100 feet of horizontal distance 4. Clay
   ____ e. Grouping of different soils according to productive capacity, use, management and conservation treatment necessary to minimize erosion 5. Soil pores
   ____ f. Crops that improve or replenish rather than deplete soil organic matter 6. Hard pan
   ____ g. Rate at which air and water move through the soil 7. Bulk density
   ____ h. Surface, dark-colored upper layer of natural soil; "A" horizon 8. Soil structure
   ____ i. Layer found just below the topsoil; "B" horizon 9. Topsoil
   ____ j. Loss of soil by actions of tillage, wind and/or water 10. Subsoil
   ____ k. Way that individual soil particles are grouped together to form clusters of particles 11. Permeability
   ____ l. Proportion of sand, silt and clay that makes up the surface soil 12. Soil depth
   ____ m. Forms lumps or clods when dry and is plastic and sticky when wet 13. Slope
   ____ n. A hardened soil layer not readily penetrated by plant roots or water 14. Erosion
   ____ o. Way that individual soil particles are grouped together to form clusters of particles 15. Surface runoff
   ____ p. Proportion of sand, silt and clay that makes up the surface soil 16. Drainage
   ____ q. Forms lumps or clods when dry and is plastic and sticky when wet 17. Climate
   ____ r. A hardened soil layer not readily penetrated by plant roots or water 18. Land capability class
   ____ s. Forms lumps or clods when dry and is plastic and sticky when wet 19. Soil conserving crops
   ____ t. A hardened soil layer not readily penetrated by plant roots or water 20. Soil improving crops
150F - 42

___o. Amount of annual precipitation and the length of the growing season; affects crops that can be grown and crop yields

___p. The gritty material which you can feel when you rub the soil with your fingers

___q. The ability of a soil to permit the downward flow of excess water to allow good aeration

___r. Total space not occupied by soil particles in a bulk volume of soil

___s. The floury material which you can feel when you rub the soil with your finger; it is not gritty and not sticky when wet

2. List three reasons for judging land.

a. ______________________________________

b. ______________________________________

c. ______________________________________

3. Select from the following list factors used in determining land capability class. Write an "X" in the blank before each correct answer.

___a. Surface texture

___b. Soil profile

___c. Climate

___d. Depth of soil

___e. Previous crop

___f. Slope

___g. Permeability

___h. Erosion

___i. Cover crops

___j. Surface runoff

___k. Drainage

___l. Shrink-swell
4. Name the three major groups of soil in relation to texture.

a. ________________________________________________________________

b. ________________________________________________________________

c. ________________________________________________________________

5. Discuss in a short paragraph the means of determining soil texture by touch.

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

6. Match the different variations of permeability, depth, slope, erosion, surface runoff, drainage and climate to the correct definition. Write the correct numbers in the blanks.

Permeability

a. Soils that have sandy subsoil
   1. Very slow

b. Soils that have highly granular, clay loam subsoil
   2. Slow

b. Soils that have dense heavy clay or clay pan subsoil
   3. Moderate

d. Soils that have crumbly, clayey subsoil
   4. Rapid

Depth of soil

a. 10 to 20 inches deep
   1. Very shallow

b. More than 60 inches deep
   2. Shallow

c. Less than 10 inches deep
   3. Moderately deep

</tbody>
</table>
Drainage

_____ a. Excess amounts drain away quickly causing drought conditions; rapidly permeable soils
1. Excessive
2. Good

_____ b. Saturation with water in root zone limited to 1 or 2 weeks; will injure plant roots
3. Somewhat poor

_____ c. Saturation with water in root zone for more than 2 weeks; severely injure plant roots so that yield is greatly reduced
4. Poor

_____ d. Saturation with water in root zone limited to a few days; plant roots are not injured

Climate

_____ a. Less than 100 frost-free days or less than 10 inches of average annual precipitation with irrigation water unavailable
1. Good
2. Fair

_____ b. More than 140 frost-free days with more than 10 inches of average annual precipitation or irrigation water available
3. Poor

_____ c. 100 to 140 frost-free days along with more than 10 inches of average annual precipitation or irrigation water available

7. Match the land capability class to the correct description. Write the correct numbers in the blanks.

_____ a. Soils having very severe limitations that make them unsuited for cultivation and restrict their use to grazing, woodland or wildlife habitat
1. Class I
2. Class II

_____ b. Soils having few limitations that restrict their use
3. Class III

_____ c. Soils having severe limitations that reduce the choice of plants or require special conservation practices, or both
4. Class IV

_____ d. Soil and land forms having limitations that preclude their use for commercial plant production and restrict their use to wildlife, recreation, water supply or scenic purposes
5. Class V
6. Class VI

7. Class VII
8. Class VIII
8. Write the best land capability class possible for each of the following land class factors. Write the correct numbers in the blanks. (Land capability classes are I, II, III, IV, V, VI, VII, VIII)

- **a.** Loamy soil
- **b.** Shallow depth
- **c.** Slow permeability
- **d.** Strongly sloping
- **e.** Severe erosion
- **f.** Very slow surface runoff

9. Select the recommended vegetative land treatments for non-irrigated Class III land that has a moderate erosion problem. Write an "X" in the blank before each correct treatment.

- **a.** Soil conserving and/or improving crops not necessary
- **b.** Use soil conserving and/or improving crops every 4th-5th year
- **c.** Use soil conserving and/or improving crops every 3rd-4th year
- **d.** Use soil conserving and/or improving crops every 2nd-3rd year
- **e.** Crop residue use
- **f.** Weed control
- **g.** Strip cropping
- **h.** Brush and tree control
i. Grasses and legumes
j. Pasture, range, hay management
k. Tree planting
l. Woodland harvest cutting
m. Wildlife, recreation and watershed

10. Select the recommended mechanical land treatments for irrigated Class II with an excessive surface runoff problem. Write an "X" in the blank before each correct treatment.

a. Land leveling and smoothing
b. Irrigation water management
c. Water control structure
d. Diversion or terrace
e. Contour farming
f. Grass waterway
g. Subsurface drainage system
h. Minimum tillage

11. Using the information on the following placard, select the correct fertilizer and soil amendments needed. Write an "X" in the blank before each correct treatment.

f. Gypsum
g. Organic matter
h. Fertilizer or amendments not needed
12. Select from the following list factors considered in homesite evaluation. Write an "X" in the blank before each correct answer.

_____ a. Surface texture
_____ b. Permeability
_____ c. Climate
_____ d. Depth of soil
_____ e. Slope
_____ f. Erosion
_____ g. Drainage
_____ h. Surface runoff
_____ i. Shrink-swell
_____ j. Soil profile
_____ k. Water table
_____ l. Flooding
_____ m. Land capability class

13. Match the variations of permeability, slope, erosion, runoff, shrink-swell, water table and flooding to the correct definitions for homesite evaluation. Write the correct numbers in the blanks.

Permeability

_____ a. Soils that have sandy subsoil; greater than 6.0 inches per hour 1. Slow
_____ b. Soils that have dense, heavy clay or crumbly, clayey subsoil; 0.2 to 6.0 inches per hour 2. Moderate
_____ c. Soils that have highly granular, clay loam or silt loam subsoil; less than 0.2 inches per hour 3. Rapid

Slope (irrigated land)

_____ a. 5 to 8 feet fall in each 100 feet 1. Nearly level
_____ b. More than 15 feet fall in each 100 feet 2. Gently sloping
_____ c. Less than 0.5 feet fall in each 100 feet 3. Moderately sloping

15. Apply the following land class factors, field conditions and placard information to the Idaho Land Judging Scorecard on page 150F-52.

a. Texture--When rubbed between the fingers, the soil feels sticky and stains your fingers

b. Permeability--Blocky, clayey subsoil

c. Depth--18 inches

d. Slope--6 inch fall in each 100 feet

e. Erosion--No gullies

f. Drainage--Root zone saturated with water limited to two weeks

(Note: See site placard on the following page.)
150F - 51

Site Placard

1. Field number 2
2. Original depth of topsoil 36 inches
3. Climate
   a. Annual precipitation 10 inches
   b. Frost-free days 120
4. Soil Analysis
   a. pH 7.5
   b. Nitrogen (NO₃) 20 ppm
   c. Phosphorus (P) 8 ppm
   d. Potassium (K) 200 ppm
   e. Zinc (Zn) 2.0 ppm
   f. Manure available
   g. Irrigation water available

16. Apply the following homesite land factors, conditions and placard information to the Homesite Evaluation Land Judging Scorecard on page 150F-53.
   a. Texture--When rubbed between the fingers, the soil feels smooth but not sticky, and stains your fingers
   b. Permeability--Granular, sandy loam subsoil
   c. Soil depth--36 inches
   d. Slope--3 feet fall in each 100 feet

Site Placard

1. Field number 3
2. Original depth of topsoil 60 inches
3. Climate
   a. Annual precipitation 16 inches
   b. Frost-free days 140
4. Soil Analysis
   a. pH 7.2
   b. Other factors
      1) Flooding--Once every six years
      2) Water table--None evident above 72 inches

Part I and II — Total Score (possible 100)
LAND EVALUATION AND USE CLASSIFICATION
AG 150 - F

ANSWERS TO TEST

1. a. 15  f. 20  k. 8  p. 2
   b. 12  g. 11  l. 1  q. 16
   c. 19  h. 9  m. 4  r. 5
   d. 13  i. 10  n. 6  s. 3
   e. 18  j. 14  o. 17

2. Answer should include three of the following:
   Aids in understanding the importance of basic soil differences as they affect crop production and erosion; Helps to determine management practices important to proper use of soil and water; Develops understanding of different soil and water conservation practices; Aids in understanding the influence of land features on production and land protection; Aids in selecting a farm for purchase or making maximum use of land

3. a, c, d, f, g, h, j, k

4. Sandy; Loamy; Clayey

5. **Sandy soils**--When rubbed between fingers this soil has a rough, gritty feeling; individual grains can be seen or felt; **Loamy soils**--When rubbed between the fingers this soil has a touch of velvet or the feel of wheat flour; it is not gritty and not sticky when wet; **Clayey soils**--Forms very hard lumps or clods when dry and is sticky when wet; when pinched out between the thumb and finger will form a long flexible "ribbon"

6. Permeability  a. 4  b. 3  c. 1  d. 2
   Depth a. 2  b. 5  c. 1  d. 4  e. 3
   Slope a. 3  b. 6  c. 5  d. 4  e. 1  f. 2
   Erosion a. 2  b. 3  c. 1
   Surface runoff a. 2  b. 1  c. 3  d. 4
   Drainage a. 1  b. 3  c. 4  d. 2
   Climate a. 3  b. 1  c. 2

7. a. 7  e. 5
   b. 1  f. 2
   c. 3  g. 4
   d. 8  h. 6

8. a. I  d. IV
   b. III e. VI
   c. II f. II

9. c, e, g

10. b, c, h

11. a, b, g
12. a, b, d, e, f, h, i, k, l

13. Permeability
   a. 3  b. 2  c. 1

   Slope
   a. 3  b. 5  c. 1  d. 4  e. 2

   Erosion
   a. 3  b. 2  c. 1

   Surface runoff
   a. 2  b. 3  c. 1

   Shrink-swell
   a. 1  b. 2  c. 3

   Water table
   a. 1  b. 2  c. 3

   Flooding
   a. 2  b. 3  c. 1

14. a. Moderate; Moderate
    b. Moderate; Severe
    c. Slight; Severe; Severe
    d. Slight; Slight; Slight
    e. Moderate; Moderate; Moderate
    f. Slight; Severe
    g. Slight; Slight
    h. Slight; Slight; Slight
    i. Moderate; Severe

#### Score Calculations

**Score Part I** (possible 20)

**Score Part II** (possible 20 for each use)

**Part I and II — Total Score** (possible 100)
UNIT OBJECTIVE

After completion of this unit, students should be able to discuss the importance of plants and crop production. Students should also be able to list the major crops of Idaho and the United States, classify plants and discuss factors affecting crop production. This knowledge will be demonstrated by completion of the unit test with a minimum of 85 percent accuracy.

SPECIFIC OBJECTIVES AND COMPETENCIES

After completion of this unit, the student should be able to:

1. Match terms associated with crop science to the correct definitions.
2. Select necessities that are furnished by plants.
3. Select crops of Idaho that rank in the top three in production in the United States.
4. Name five major crops grown in the U.S.
5. Classify plants by matching them with the correct class.
6. Match common crops of Idaho with their average yields.
7. List four factors that affect the amount of crop that can be produced.
8. State the purpose of the Idaho Crop Improvement Association.
9. Discuss the information put together by the Idaho Agricultural Statistics Service and the people who use this information.
INTRODUCTION TO CROP SCIENCE
AG 150 - G

SUGGESTED ACTIVITIES

I. Suggested activities for instructor
   A. Order materials to supplement unit.
      1. Literature
         a. *Idaho Agricultural Statistics*; available from Idaho Agricultural
            Statistics Service, Boise, Idaho; cost $5.00.
         b. *Summary of Findings and Recommendations of the Governor's Task*
   B. Make transparencies and necessary copies of materials.
   C. Provide students with objective sheet and discuss.
   D. Provide students with information sheet and discuss.
   E. Construct and administer pretest on crop science.
   F. Invite someone to speak on careers in crop science.
   G. Review and give test.
   H. Reteach and retest if necessary.

II. Instructional materials
   A. Objective sheet
   B. Suggested activities
   C. Information sheet
   D. Transparency masters
      1. TM 1--Good Things We Get From Plants
      2. TM 2--Idaho Crop-Reporting Districts
      3. TM 3--Major Crops of Idaho
   E. Test
   F. Answers to test
III. Unit references

F. *In Small Grains, Let's Aim For Quality*, Idaho Crop Improvement Association, Boise, Idaho.

INTRODUCTION TO CROP SCIENCE
AG 150 - G

INFORMATION SHEET

I. Terms and definitions

A. Agronomy--Science of crop production and soil management

B. Arable land--Land, which is capable in its present condition of producing, crops requiring tillage

C. Arid climate--Climate in which the annual rainfall is less than 10 inches

D. Cereal--Grass grown to be used for feed or seed

E. Forage--Livestock feed, such as pasture, hay or silage

F. Legume--Soil improving plant, which manufactures nitrogen

G. Pulse--Leguminous plants or their seeds; this includes chiefly those plants with large seeds used for food

H. Range--Extensive area of natural pastureland

I. Weed--Undesirable plant growing with a crop

J. Native plant--Plant originating in North America

K. Introduced plant--Plant brought in from countries outside the United States

L. Cwt--Hundred weight, 100 pounds

M. Bushel--Thirty-two dry quarts; a common measurement for small grains

N. Ton--Two thousand pounds; a common measurement for forage, sugar beets and sweet corn

II. Plants furnish the following necessities (Transparency 1)

A. Oxygen for man and animals to breathe

B. Fuel for heating and transportation

C. Building materials

D. Medicine and drugs

E. Food for man and animal nutrition

F. Fabric for clothing and other purposes
G. Paper

H. Cover against wind and water

I. Habitat for animals

(Note: Plants furnish most of the necessities of life for man either directly or indirectly. If plant life suddenly disappeared, man and animal would also disappear. Plants are the basis of all food we eat and all the oxygen we breathe.)

III. Major agronomic crops grown in Idaho (1988) (Transparencies 2, 3)

IV. Major crops of the United States

A. Corn

B. Wheat (winter and spring)

C. Oats

D. Barley

E. Rye

F. Grain sorghum

G. Cotton
H. Tobacco
I. Rice
J. Sugar crops
K. Alfalfa
L. Soybeans
M. Peanuts

V. Classes of plants
A. Cereals
   1. Barley
   2. Wheat
   3. Corn
   4. Oats
   5. Rice
B. Root crops
   1. Potatoes
   2. Sugar beets
C. Tree crops
   1. Prunes and plums
   2. Apples
   3. Sweet cherries
D. Pulses
   1. Peas
   2. Lentils
   3. Beans
E. Oil seed crops
   1. Sunflower
   2. Soybean
3. Peanut
4. Cotton seed

F. Forage crops
1. Alfalfa hay
2. Field corn
3. Most grasses

VI. How much crop can be produced per acre?
A. Average yields in Idaho for 1988 include:
   1. Barley 60 bu/acre
   2. Corn for grain 130 bu/acre
   3. Dry beans, combined 18.9 cwt/acre
   4. Alfalfa hay 3.8 ton/acre
   5. Lentils 13 cwt/acre
   6. Potatoes 286 cwt/acre
   7. Sugar beets 24.5 ton/acre
   8. Wheat 65.7 bu/acre

B. Record yields recorded
   1. Potatoes 1,000 cwt/acre
   2. Dry land wheat 208 bu/acre

VII. Factors that affect amount of crop produced
A. Crop being raised
   (Note: This is dictated by area and will be related to the presence or absence of other factors such as length of growing season, soil type, pests, etc.)

B. Climate
   1. Annual precipitation
   2. Temperature
   3. Length of growing season
4. Methods of modifying climate available
   a. Irrigation
   b. Frost protection
   c. Variety selection
   d. Seedbed preparation
   e. Field choice, for example: North Slope vs. South Slope

C. Pests
   1. Resistant varieties
   2. Pesticides
   3. Plant dates

D. Soil features
   1. Seedbed preparation
   2. Cultivation

E. Economics
   (Note: This is the least controllable of all factors. The goal of crop production is to get the highest amount of yield with the fewest inputs. The maximum yield is not always the same as the maximum profit point. The crop can cost you money by (1) decreased yields or (2) money for added inputs. Manage to reach the point of maximum profit.)

VIII. Purpose of Idaho Crop Improvement Association--To maintain and make available to the public a maximum amount of high quality seeds of superior plant varieties at a reasonable price

IX. Idaho Agricultural Statistics Service
   A. The "fact finders" for Idaho agriculture
      1. Prospective production and supplies of food and fiber
      2. Prices paid and received by farmers
      3. Farm labor and wages
      4. Storage holding of commodities
      5. Numbers and sizes of farms
      6. Weekly weather and crop bulletins
B. Information users include:

1. Farmers and ranchers--Decisions on how much to plant, how many cattle to raise or when to sell

2. Manufacturers--Help predict demand

3. Business persons

4. Economists

5. State and federal officials

6. Members of Congress
Good Things
We Get From Plants

1. Oxygen for man and animal to breath
2. Fuel for heating and transportation
3. Building materials
4. Medicines and drugs
5. Food for man and animal nutrition
6. Fabric for clothing and other purposes
7. Paper
8. Cover against wind and water
9. Habitat for animals

INTRODUCTION TO CROP SCIENCE
AG 150 - G

UNIT TEST

Name ______________________________________________  Score ______________________

1. Match terms associated with crop science to the correct definitions. Write the correct numbers in the blanks.

   ____ a. Extensive area of natural pasture land 1. Agronomy
   ____ b. 100 pounds 2. Arable land
   ____ c. Grass grown to be used for feed or seed 3. Arid climate
   ____ d. Plant originating in North America 4. Cereal
   ____ e. Undesirable plant growing with a crop 5. Forage
   ____ f. Livestock feed, such as pasture, hay or silage 6. Legume
   ____ g. Land which is capable in its present condition of producing crops requiring tillage 7. Pulse
   ____ h. Soil improving plant which manufactures nitrogen 8. Range
   ____ i. Science of crop production and soil management 9. Weed
   ____ j. Plant brought in from countries outside the United States 10. Native plant
   ____ k. Thirty-two dry quarts; a common measurement for small grains 11. Introduced plant
   ____ l. Leguminous plants or their seeds; this includes chiefly those plants with large seeds used for food 12. Cwt
   ____ m. 2,000 pounds; a common measurement for forage, sugar beets and sweet corn 13. Bushel
   ____ n. Climate in which the annual rainfall is less than 10 inches 14. Ton
2. Select from the following list necessities that are furnished by plants. Write an "X" in the blank before each correct answer.

_____ a. Food
_____ b. Synthetic plastic products
_____ c. Medicine and drugs
_____ d. Paper
_____ e. Water
_____ f. Building materials
_____ g. Fuel for heating
_____ h. Oxygen
_____ i. Diseases
_____ j. Fabric for clothing and other purposes

3. Select from the following list crops of Idaho that rank in the top three in production in the United States. Write an "X" in the blank before each correct answer.

_____ a. Wheat
_____ b. Corn grain
_____ c. Potatoes
_____ d. Barley
_____ e. Peas
_____ f. Lentils
_____ g. Apples
_____ h. Alfalfa seed
_____ i. Sugar beets
_____ j. Sweet corn

4. Name five major crops grown in the United States.

a. __________________________________________

b. __________________________________________

c. __________________________________________
5. Classify the following plants as a cereal (C), root crop (R), tree crop (T), pulse (P), oil seed (O) or forage crop (F). Write the correct letters in the blanks.

____ a. Potatoes  
____ b. Soybeans  
____ c. Wheat  
____ d. Field corn  
____ e. Lentils  
____ f. Sweet cherries  
____ g. Alfalfa hay  
____ h. Oats  
____ i. Beans  
____ j. Cotton seed

6. Match common crops of Idaho with the correct average yield. Write the correct numbers in the blanks.

1. 286 bu/acre  
   ____ a. Potatoes

2. 60 bu/acre  
   ____ b. Lentils

3. 130 bu/acre  
   ____ c. Corn for grain

4. 18.9 cwt/acre  
   ____ d. Barley

5. 3.8 ton/acre  
   ____ e. Wheat

6. 3.8 bu/acre  
   ____ f. Sugar beets

7. 13 cwt/acre  
   ____ g. Dry beans

8. 286 cwt/acre  
   ____ h. Alfalfa hay

9. 24.5 ton/acre  
   ____ i. Beans

10. 65.7 bu/acre  
    ____ j. Cotton seed
7. List four factors that affect the amount of crop that can be produced.
   a. __________________________________________________________________________
   b. __________________________________________________________________________
   c. __________________________________________________________________________
   d. __________________________________________________________________________

8. State the purpose of the Idaho Crop Improvement Association.
   _____________________________________________________________________________
   _____________________________________________________________________________
   _____________________________________________________________________________

9. Discuss the information put together by the Idaho Agricultural Statistics Service and the people who use this information.

INTRODUCTION TO CROP SCIENCE

AG 150 - G

ANSWERS TO TEST

1. a. 8  e. 9  i. 1  m. 14
   b. 12  f. 5  j. 11  n. 3
   c. 4  g. 2  k. 13
   d. 10  h. 6  l. 7

2. a, c, d, f, g, h, j

3. c, d, e, f, h, i

4. Answer should include five of the following:
   Corn; Wheat; Oats; Barley; Rye; Grain sorghum; Cotton; Tobacco; Rice; Sugar crops; Alfalfa; Soybeans; Peanuts

5. a. R  f. T
   b. O  g. F
   c. C  h. C
   d. F  i. P
   e. P  j. O

6. a. 8  e. 10
   b. 7  f. 9
   c. 3  g. 4
   d. 2  h. 5

7. Answer should include four of the following:
   Crop being raised; Climate; Pests; Soil features; Economics

8. To maintain and make available to the public a maximum amount of high quality seeds of superior plant varieties at a reasonable price

9. Answer should include information from the following:
   The "fact finders" for Idaho agriculture; Prospective production and supplies of food and fiber; Prices paid and received by farmers; Farm labor and wages; Storage holding of commodities; Numbers and sizes of farms; Weekly weather and crop bulletins; Farmers and ranchers--Decisions on how much to plant, how many cattle to raise or when to sell; Manufacturers--Help predict demand; Business persons; Economists; State and federal officials; Members of Congress
UNIT OBJECTIVE

After completion of this unit, students should be able to list the important plant processes, illustrate the process of photosynthesis and select factors that affect photosynthetic rate. Students should also be able to briefly explain the processes of absorption and transpiration. This knowledge will be demonstrated by completing the unit test with a minimum of 85 percent accuracy.

SPECIFIC OBJECTIVES AND COMPETENCIES

After completion of this unit, the student should be able to:

1. Match terms associated with basic plant processes to the correct definitions.
2. Name the four important plant processes in food manufacture and growth.
3. Select reasons photosynthesis is the most important process in the world.
4. Explain the process of photosynthesis.
5. Select factors that affect photosynthetic rate.
6. Explain the process of respiration.
7. Classify characteristics as that of photosynthesis or respiration.
8. Explain the process of absorption by plant roots.
9. Explain the process of transpiration.
10. Select factors affecting water loss by transpiration.
11. Study the effect of light on dry weight.
12. Measure loss from transpiration.
BASIC PLANT PROCESSES
AG 150 - H

SUGGESTED ACTIVITIES

I. Suggested activities for instructor
   A. Order materials to supplement unit.
   B. Make transparencies and necessary copies of materials.
   C. Provide students with objective sheet and discuss.
   D. Provide students with information and assignment sheets, and laboratory exercise.
   E. Discuss information and assignment sheets.
   F. Demonstrate and discuss procedures outlined in laboratory exercise.
   G. Review and give test.
   H. Reteach and retest if necessary.

II. Instructional materials
   A. Objective sheet
   B. Suggested activities
   C. Information sheet
   D. Transparency masters
      1. TM 1--Important Plant Processes
      2. TM 2--Importance of Photosynthesis
      3. TM 3--Photosynthesis
      4. TM 4--Photosynthesis and Respiration in Relation to Dry Weight
      5. TM 5--Transpiration
      6. TM 6--Root Hairs, Soil Particles and Moisture
      7. TM 7--How a Water Solution From the Soil Moves Within a Root
   E. Assignment sheet
      1. AS 1--Effect of Light on Dry Weight
F. Answers to assignment sheet

G. Laboratory exercise
   1. LE 1--Measuring Loss From Transpiration

H. Test

I. Answers to test

III. Unit references

I. Terms and definitions

A. Photosynthesis--The process of making sugars in green plants from water and carbon dioxide in the presence of sunlight

B. Respiration--The process of using the stored foods of a plant in which energy is obtained or released

C. Transpiration--The evaporation of water vapor from the stoma on the leaves of a plant

D. Absorption--The taking in of water and mineral nutrients through the roots of a plant

E. Stoma--A small opening in the epidermis of leaves and stems through which gases pass

F. Mesophyll--The photosynthetic tissue of a leaf, located between the layers of epidermis

G. Chlorophyll--The green pigment of plant cells; necessary for photosynthesis

H. Chloroplast--A cellular organelle in which chlorophyll is contained; site of photosynthesis

I. Phloem--Food conducting tissue of plants

J. Root hairs--Outgrowths of the epidermal cells of the root; greatly increase absorption area of the root system

K. Permeable membrane--A membrane through which liquid substances may diffuse, such as the plasma membrane of root hair cells

L. Epidermis--The outermost layer of cells of the leaf and of young stems and roots

M. Cortex--Cells of a stem or root bound externally by the epidermis and internally by the vascular system

N. Xylem--Tissue through which most of the water and minerals of a plant are conducted

O. Osmosis--The diffusion of water through a selectively permeable membrane
II. Important plant processes in food manufacture and growth  (Transparency 1)

A. Photosynthesis
B. Respiration
C. Transpiration
D. Absorption

III. Reasons photosynthesis is the most important process in world  (Transparency 2)

A. Plants produce food by photosynthesis
B. Plants produce food used directly by man
C. Plants produce food used indirectly by man through meat and milk produced by livestock

(Note: Green plants, through the process of photosynthesis, are the basic factories of the world on which all life is dependent. A corn plant produces about 5 grams of sugar during 14 hours of sunlight. During a 100-day period, a 20-acre field of corn with 20,000 plants per acre could produce two and one-half tons of sugar. An estimated 150 billion tons of sugar are produced by plants each year by photosynthesis. This would be a pile of sugar 40 miles square at the base and 2 miles high at the peak.)

IV. Process of photosynthesis  (Transparency 3)

A. Carbon dioxide (CO₂) enters the leaf from the surrounding air through the stoma

(Note: After CO₂ enters the stoma, it enters the intercellular spaces of the mesophyll tissue. Here it comes in contact with the wet walls of the mesophyll cells. The CO₂ dissolves in the water of the mesophyll cells.)

B. Water moves from the soil into the root, stems and leaves through the xylem tissue

C. The molecules of water (H₂O) and carbon dioxide (CO₂) are synthesized (put together) in the chlorophyll of a plant with energy from sunlight

D. The end result is the formation of sugar, which is transported by the phloem tissue to the part of the plant where it is used

(Note: The process can be illustrated by the chemical equation which is written: 6 parts carbon dioxide (6 CO₂) + 6 parts water (6 H₂O) + 672 K cal of radiant energy (sunlight) in the presence of chlorophyll of plants = sugar (C₆H₁₂O₆) retained by the plant + oxygen (6 O₂) given off into the atmosphere.)
V. Factors that affect photosynthetic rate
   A. Water supply
   B. Temperature
   C. Light quality
   D. Light intensity
   E. Deficiency of certain plant nutrients

VI. Process of respiration
   (Note: As with all living things, plants require energy to carry out their growth and development process. This energy comes from a very complex process called respiration. In a sense, respiration in plants is the reverse of photosynthesis as sugar is broken down to produce energy.)
   A. Sugar is broken down to produce energy for essential plant functions
   B. Respiration consumes oxygen (O₂) and glucose (C₆H₁₂O₆)
   C. Respiration gives off carbon dioxide (CO₂) and water (H₂O)
   (Note: The process can be illustrated by the chemical equation which is written:
   Sugar (C₆H₁₂O₆) + 6 parts oxygen (6 O₂) = 6 parts carbon dioxide (6 CO₂) + 6 parts water (6 H₂O).)

VII. Relationship between photosynthesis and respiration (Transparency 4)

<td>7. Energy produced for plant functions is end product</td>
</tr>
</tbody>
</table>

(Note: A green plant grown in the dark loses in weight because its stored foods are respired and nothing is added through photosynthesis.)
VIII. The process of absorption
A. The soil solution enters the root hairs by the process of osmosis  
   (Note: The soil solution is composed of water and minerals in solution.)
B. After the soil solution is absorbed by the root hairs, it moves through the epidermal cells, cortex and phloem to the xylem
C. The xylem conducts the solution to other parts of the plant

IX. The process of transpiration (Transparencies 5, 6, 7)
A. Water enters plant through root hairs
B. Water passes to xylem and up the stem to the leaves
C. A small amount of water is used in photosynthesis
D. The remainder is lost by transpiration  
   (Note: Water loss occurs mainly through the stoma on the leaves. When stoma are open, water vapor, which is low in carbon dioxide, escapes from the leaf and is replaced by dry air higher in carbon dioxide.)

X. Factors affecting water loss by transpiration
A. Climatic conditions
B. The number of stoma on the leaves
C. Availability of soil moisture to the plant
D. General plant structure  
   (Note: Some plants have a waxy covering called a cuticle which inhibits evaporation of water. Some plants have stoma only on lower side of leaf where temperatures are cooler.)
E. Soil fertility  
   (Note: Transpiration is greater for plants in fertile soils than poor soils; therefore, the plant uses more water on fertile soils than poor soils.)
A series of events must take place for plant growth to occur. Important ones are:

- Photosynthesis
- Respiration
- Transpiration
- Absorption
Importance of Photosynthesis

Through the process of photosynthesis, crop plants produce food. This plant-produced food is used directly by man or indirectly through meat and milk produced by livestock.
Photosynthesis

- **Sunlight**
- **Green plants** (contains chlorophyll)
- **Favorable temperature**
- **Carbon dioxide** + **Water** + **Light** → **Glucose** + **Water** + **Oxygen**
  
  \[
  6\text{CO}_2 + 12\text{H}_2\text{O} + \text{Light} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{H}_2\text{O} + 6\text{O}_2
  \]

- **CO}_2**
- **H}_2\text{O**
Photosynthesis and Respiration in Relation to Dry Weight

Daylight hours
- The sugar produced by photosynthesis is greater than the sugar used by respiration.
- Result is increase in dry weight.

Dark hours
- No sugar is produced by photosynthesis.
- Sugar is used by respiration.
- Result is decrease in dry weight.
Transpiration

Is the loss of water from plants by evaporation
Root Hairs, Soil Particles and Moisture

1. Root hairs increase the absorption area of the root system 3 to 5 times.
2. Water and minerals in solution enter the plant mainly through the root hairs.
How a Water Solution From the Soil Moves Within the Root

1. Solution enters the root hair by osmosis.
2. Solution moves through the epidermal cells, the cortex and the phloem to the xylem tissue.
3. Solution is transported by the xylem to other parts of the plant.
BASIC PLANT PROCESSES

AG 150 - H

ASSIGNMENT SHEET #1--EFFECT OF LIGHT ON DRY WEIGHT

Name ______________________________________________  Score ______________________

Part I

Three hundred bean seeds were divided into three lots of 100 each. One lot of 100 seeds was used to measure the percent moisture in the seeds, from which it was possible to calculate the dry weight of the other two lots. A second lot of seeds was sown in sand in a suitable box and kept in a dark room. The third lot was likewise sown in sand in a suitable box and kept under a daily cycle of 15 hours of light and 9 hours of dark. These two lots of seeds were kept at a temperature of 75°F. Four weeks after planting, each lot of resulting seedlings was harvested and the dry weight of each was measured. The resulting data are tabulated.

Part II

a. What one environmental factor was varied in this experiment?

b. How do you account for the increase in dry weight of the seedlings in light as compared with the dry weight of the seeds, which were planted in darkness?
c. Why do the seedlings that developed in the dark not gain in dry weight?

d. Why do the seedlings that developed in the dark actually decrease in dry weight?

e. Is light necessary for the utilization of food in the growth of plants?
Assignment Sheet #1

a. Light

b. Photosynthesis is greater than respiration

c. Respiration is greater than photosynthesis

d. Sugars are utilized by respiration for basic functions of the plant without being replenished by photosynthesis

e. Yes
LABORATORY EXERCISE #1--MEASURING LOSS FROM TRANSPERSION

Name ______________________________________________  Score ______________________

I. Materials needed
   A. A growing plant in a pot, bucket or other container or a plant growing in a convenient location
   B. Plastic bag or sheet of clear plastic that will cover the plant or a branch of the plant containing 10 to 12 leaves
   C. String, rubber bands or other suitable tie materials
   D. Stake to support the weight of the plastic
   E. Plastic straw or other suitable tubing for a drain
   F. Measuring cup or beaker

II. Procedure (Figure 1)
   A. Be sure plant has been watered
   B. Cover the entire vegetative portion of the plant or a section with plastic material
   C. Locate tubing at bottom of plastic covering to serve as a water drain
   D. Place plant in sunny location for an entire day; measure the water collected; empty container
   E. Measure water collected during dark period of the day
   F. Compare differences in the amount of water collected
III. Questions

a. Which period produced the most water in the container? Why?

b. Does temperature have an effect on transpiration rates? Does light? Air humidity?
ANSWERS TO LABORATORY EXERCISES

Lab # 1

Part III:

a. Most water into container during the daylight period
   Why? Stomata are open during the day, allowing water to escape

b. Temperature - as temperature increases, transpiration increases
   Light - light increases temperature, which increases transpiration
   Air humidity - as humidity increases, it lowers transpiration
1. Match terms associated with basic plant processes to the correct definitions. Write the correct numbers in the blanks.

   _____a. A small opening in the epidermis of leaves and stems through which gases must pass
   1. Photosynthesis
   2. Respiration
   3. Osmosis
   4. Absorption
   5. Stoma
   6. Mesophyll
   7. Chlorophyll
   8. Chloroplast
   9. Phloem
   10. Root hairs
   11. Permeable membrane
   12. Epidermis
   13. Cortex
   14. Xylem
   15. Transpiration
   _____b. The green pigment of plant cells; necessary for photosynthesis
   _____c. The process of making sugars in green plants from water and carbon dioxide in the presence of sunlight
   _____d. Food conducting tissue of plants
   _____e. The outermost layer of cells of the leaf and of young stems and roots
   _____f. The evaporation of water vapor from the stoma on the leaves of a plant
   _____g. A cellular organelle in which chlorophyll is contained; site of photosynthesis
   _____h. Tissue through which most of the water and minerals of a plant are conducted
   _____i. The photosynthetic tissue of a leaf; located between the layers of epidermis
   _____j. The process of using the stored foods of a plant in which energy is obtained or released
   _____k. A membrane through which liquid substances may diffuse
   _____l. The taking in of water and mineral nutrients through the roots of a plant
   _____m. Cells of a stem or root bound externally by the epidermis and internally by the vascular system
   _____n. Outgrowths of the epidermal cells of the root; greatly increase absorption area of the root system
   _____o. The diffusion of water through a selectively permeable membrane
2. Name the four important plant processes in food manufacture and growth.
   a. __________________________________________________________________________
   b. __________________________________________________________________________
   c. __________________________________________________________________________
   d. __________________________________________________________________________

3. Select from the following list reasons photosynthesis is the most important process in the world. Write an "X" in the blank before each correct answer.
   _____ a. Produces food used directly by man
   _____ b. Releases carbon dioxide
   _____ c. It warms the soil
   _____ d. Produces food used indirectly by man
   _____ e. All life is dependent on photosynthesis
   _____ f. Releases moisture into the atmosphere

4. Explain the process of photosynthesis.
   ______________________________________________________________________________
   ______________________________________________________________________________
   ______________________________________________________________________________
   ______________________________________________________________________________
   ______________________________________________________________________________
   ______________________________________________________________________________
   ______________________________________________________________________________
   ______________________________________________________________________________

5. Select from the following list factors that affect photosynthetic rate. Write an "X" in the blank before each correct answer.
   _____ a. Nutrient deficiency
   _____ b. Energy produced
   _____ c. Water supply
6. Explain the process of respiration.

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________

7. Classify the following characteristics as that of photosynthesis (X) or respiration (O). Write the correct letter in the blank before each statement.

_____ a. Sugar is the end product
_____ b. Carbon dioxide is given off
_____ c. Requires light
_____ d. A destruction process
_____ e. Goes on day and night
_____ f. A building process
_____ g. Only takes place in cells containing chlorophyll
_____ h. Carried on in all cells
_____ i. Oxygen is given off
_____ j. Sugars consumed

8. Explain the process of absorption by plant roots.

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________

____ d. Absorption rate
____ e. Quality of light
____ f. Temperature
____ g. Intensity of light
9. Explain the process of transpiration.

______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________
______________________________________________________________________________

10. Select from the following list factors affecting water loss by transpiration. Write an "X" in the blank before each correct answer.
   
   _____ a. Amount of available water
   _____ b. Number of root hairs
   _____ c. Presence of cuticle on leaf
   _____ d. Number of stoma on leaf
   _____ e. Soil fertility
   _____ f. Type of root structure
   _____ g. Climatic conditions
   _____ h. Amount of sunlight
BASIC PLANT PROCESSES

AG 150 - H

ANSWERS TO TEST

1. a. 5  f. 15  k. 11  
b. 7  g. 8  l. 4  
c. 1  h. 14  m. 13  
d. 9  i. 6  n. 10  
e. 12  j. 2  o. 3

2. Photosynthesis; Respiration; Transpiration; Absorption

3. a, d, e

4. Carbon dioxide (CO₂) enters the leaf from the surrounding air through the stoma; Water moves from the soil into the root, stems and leaves through the xylem tissue; The molecules of water (H₂O) and carbon dioxide (CO₂) are synthesized (put together) in the chlorophyll of a plant with energy from sunlight; The end result is the formation of sugar which is transported by the phloem tissue to the part of the plant where it is used

5. a, c, e, f, g

6. Sugar is broken down to produce energy for essential plant functions; Respiration consumes oxygen (O₂) and glucose (C₆H₁₂O₆); Respiration gives off carbon dioxide (CO₂) and water (H₂O)

7. a. X  e. O  i. X  
b. O  f. X  j. O  
c. X  g. X  
d. O  h. O

8. The soil solution enters the root hairs by the process of osmosis; After the soil solution is absorbed by the root hairs, it moves through the epidermal cells, cortex and phloem to the xylem; The xylem conducts the solution to other parts of the plant

9. Water enters plant through root hairs; Water passes to xylem and up the stem to the leaves; A small amount of water is used in photosynthesis; The remainder is lost by transpiration

10. a, c, d, e, g
UNIT OBJECTIVE

After completion of this unit, students should be able to match terms and definitions, identify the parts of a plant and match functions and plant parts. Students should also be able to list requirements for good seed germination and select factors that cause poor germination. This knowledge will be demonstrated by completion of the unit test with a minimum of 85 percent accuracy.

SPECIFIC OBJECTIVES AND COMPETENCIES

After completion of this unit, the student should be able to:

1. Match terms associated with plant growth and development to the correct definitions.
2. Name the three stages of plant growth and development.
3. Name three requirements for good seed germination.
4. Select factors that cause poor seed germination.
5. Label a drawing showing the four primary parts of a plant.
6. Match functions of plant parts to the correct part.
7. Name two types of root systems.
8. Label a drawing showing the parts of a stem.
9. Match stem modifications with the correct description.
10. Select conditions affecting the vegetative growth of crop plants.
11. Name two means of reproduction by plants.
12. Label a drawing showing the parts of a complete flower.
13. Match the type of flower to the correct description.
14. Match the types of pollination to the correct description.
SUGGESTED ACTIVITIES

I. Suggested activities for instructor
   A. Order materials to supplement unit.
      1. Literature
         a. *Agronomy Curriculum Materials Packet*, 232 pages; available from
            IAVIM, 208 Davidson Hall, Iowa State University, Ames, Iowa
            50011; approximate cost $10.00; order no. 214.
         b. *Crop Production*, 15 transparency masters; available from IAVIM,
            208 Davidson Hall, Iowa State University, Ames, Iowa 50011;
            approximate cost $2.25; order no. 517.
      2. Filmstrips, slideshows, etc.
         a. *Agronomy*, computer program; available from IAVIM, 208
            Davidson Hall, Iowa State University, Ames, Iowa 50011;
            approximate cost $15.00; order no. 902.
   B. Make transparencies and necessary copies of materials.
   C. Provide students with objective sheet and discuss.
   D. Provide students with information sheets and discuss.
   E. Review and give test.
   F. Reteach and retest if necessary.

II. Instructional materials
   A. Objective sheet
   B. Suggested activities
   C. Information sheet
   D. Transparency masters
      1. TM 1--Primary Parts of a Plant
      2. TM 2--Functions of Leaves, Stems, Roots and Flowers
      3. TM 3--Types of Root Systems
      4. TM 4--Parts of the Stem
5. TM 5--Above Ground Stem Modifications
6. TM 6--Below Ground Stem Modifications
7. TM 7--Conditions Affecting the Vegetative Growth of Crop Plants
8. TM 8--Comparison of Utilization of Sunlight by Crop Plants
9. TM 9--Plant Growth Variance With Temperature Change
10. TM 10--Rate of Photosynthesis and Respiration as Affected by Temperature
11. TM 11--Approximate Pounds of Water Required to Produce One Pound of Dry Matter
12. TM 12--Parts of a Complete Flower
13. TM 13--Self-pollination and Cross-pollination

PLANT GROWTH AND DEVELOPMENT
AG 150 - I

INFORMATION SHEET

I. Terms and definitions

A. Node--The part of a stem where a leaf is attached
B. Internode--The part of a stem between two nodes
C. Bud--An embryonic shoot of a plant
D. Leaf scar--A scar left on the stem when a leaf falls
E. Vascular bundle scar--A spot within a leaf scar left by the vascular bundles when a leaf falls
F. Monocot--Plant having one seed leaf (cotyledon) as in cereals and corn
G. Dicot--Plant having two seed leaves (cotyledons) as in beans and peas
H. Vascular bundle--A strand of tissue containing xylem and phloem enclosed by a sheath of cells
I. Xylem--Vascular tissue that transports water and minerals from the root system to the leaves
J. Phloem--Vascular tissue that conducts food from the leaves to regions of growth or storage
K. Pistil--Seed bearing organ of a flower, composed of the ovary, style and stigma
L. Stamen--Part of the flower which produces the pollen; composed of the filament and anther
M. Fertilization--Union of the male (pollen) nucleus with the female (egg) cell
N. Pollination--Transfer of pollen from the anther to the stigma
O. Embryo--The young plantlet within the seed; the germ
P. Radicle--The embryonic root
Q. Hypocotyl--The part of an embryo between the cotyledons and the radicle
R. Epicotyl--The part of the embryo above the cotyledons and below the next leaves
II. Stages of plant growth and development
   A. Seed germination and seedling growth
   B. Vegetative
   C. Reproduction

III. Requirements for good seed germination
   A. Proper temperature
      (Note: This requirement varies for different crops. Cereals will show some germination at 32°F, while corn will not show any germination until 48°F.)
   B. Sufficient moisture
      (Note: This requirement varies for different crops. Cereals will germinate when their moisture content is about 50%. Soybeans will not germinate until their moisture content is about 75%. The range is 26% to 75% for most agronomic crops.)
   C. Ample supply of oxygen
      (Note: Germination will not occur if oxygen is not available for crops like small grains and peas. Rice seed can germinate in the absence of oxygen.)

IV. Factors that cause poor seed germination
   A. Mechanical injury to seed (cracked grain)
   B. Disease
   C. Storage conditions
      (Note: Temperature and humidity are important considerations for storage of crop seeds.)
   D. Age of seed
      (Note: Germination percentages will decrease as the age of the seed increases.)
   E. Soil temperature too cold
   F. Hard seed coat
      (Note: Some plants (hard-seeded legumes) produce seeds with a hard seed coat. The seed coat will not allow moisture and oxygen to enter the seed and bring about germination.)
   G. Soil moisture insufficient
   H. Planting too deep
I. Chemical damage

(Note: Reduced germination percentages may result if seeds come in contact with chemicals such as fertilizers.)

J. Crusting of soil

V. Primary parts of a plant (Transparency 1)

A. Roots
B. Stem
C. Leaves
D. Flowers

VI. Functions of plant parts (Transparency 2)

A. Roots

1. Absorb water and nutrients

(Note: Most of absorption takes place through root hairs. The rate at which water is absorbed depends on (1) the rate at which water is lost from leaves (transpiration), (2) the amount of water in the soil, and (3) the amount of root surface in contact with soil particles.)

2. Anchor and support plants

(Note: The roots must anchor the plant to the extent that wind, etc., cannot knock it down.)

3. Store food

(Note: Some plants store foods they have manufactured in the roots. Examples are radishes, carrots, sweet potatoes and sugar beets.)

B. Stem

1. Supports leaves, flowers, fruit and seeds

2. Conducts water, nutrients and food

(Note: The stem conducts water and minerals in solution from the root system through the xylem tissue to the leaves. It also conducts food made in the leaves through the phloem tissue to the parts of the plant where it is growing or food is being stored.)

3. Stores food

(Note: Examples of plants that store food in the stem include potatoes and asparagus.)
C. Leaves
   1. Manufacture food for the plant
      (Note: Photosynthesis is the process by which leaves make food from
carbon dioxide and water in the presence of sunlight.)
   2. Necessary for transpiration
   3. Store food
      (Note: Examples of plants that store food in the leaves include lettuce,
cabbage, celery, rhubarb and onions.)

D. Flowers
   1. Serve as site of reproduction
   2. Store food
      (Note: Examples of plants that store food in flowers include grains, fruits,
nuts, berries, broccoli and cauliflower.)

VII. Types of root systems (Transparency 3)
   A. Tap root system
      (Note: In this system, one root is larger than the rest. Examples of plants with tap
      root systems include alfalfa, sugar beets, beans, carrots and radishes.)
   B. Fibrous root system
      (Note: In this system, all roots are approximately the same size. Examples of
      plants with fibrous root systems include all the grasses and cereal grains.)

VIII. Parts of the stem (Transparency 4)
   A. Node
   B. Internode
   C. Terminal bud
   D. Lateral bud
   E. Leaf scar
   F. Vascular bundle scar
IX. Stem modifications (Transparency 5)

A. Above ground

1. Crown--Appears just above or just below ground level from which modified stems grow. This type of growth is common in small grains

2. Stolon--Runners that grow along top of soil surface. This type of growth is common in strawberry plants and clover

3. Spur--Modified stem growth that appears laterally on branches of fruit trees and bears fruit

B. Below ground (Transparency 6)

1. Rhizome--Underground stems that grow horizontally below soil surface. This type of growth is common to bluegrass, brome grass, quack grass and canada thistle

2. Tuber--Enlarged fleshy parts found at the tip of a rhizome. This type of growth is common to potatoes

3. Corm--Fleshy, short underground stems with very few buds. This type of growth is common to timothy and gladiolus

4. Bulb--Short disc-shaped stem surrounded by leaf-like scale structures. This type of growth is common to onion and garlic

X. Conditions affecting the vegetative growth of crop plants (Transparency 7)

A. Climate

1. Sunlight (Transparency 8)

(Note: Sunlight is the energy source for photosynthesis. More efficient use of sunlight by a crop plant will result in higher yields, if other factors are not limiting.)

2. Temperature (Transparencies 9, 10)

(Note: The temperature of both air and soil affects the rates at which the different plant processes take place. Air temperature affects the rate of photosynthesis, respiration and transpiration. Soil temperature has an effect on respiration and absorption by the roots.)

3. Water (Transparency 11)

(Note: Water can be a severe limiting factor in the growth of crop plants. The availability of water, either by precipitation or irrigation, influences crop yield more than any other factor. Water is a requirement for food manufacture, a solvent for mineral nutrients and a part of the transpiration process.)
B. Soil features
   1. Nutrient availability
   2. Moisture storage
   3. Soil compaction
      a. Reduced water infiltration
      b. Reduced root penetration
   4. Amount of erosion

C. Crop pests
   1. Disease
   2. Insects
   3. Weeds

D. Crop being produced

E. Economics
   (Note: Economics is the least controllable of all variables affecting crop production. In many cases the point of maximum yield is not the same as maximum profit point. Crops should be managed to reach the point of maximum profit.)

XI. Sexual reproduction in plants

A. Reproduction by seed
   1. Involves the combination of two different sets of genes to create offspring with a new genetic makeup
   2. Often the most efficient and economical method for reproducing annual bedding plants and some biennials and perennials
   3. The function of the seed is to produce a new plant
      a. A seed is produced by the combination of nuclear material in the process of fertilization
      b. Results in zygote formation

B. Sexual reproduction usually used for annuals and on plants which grow quickly from seed and produce a plant similar to the parents
   (Note: The end result of sexual reproduction in plants is the seed. Seeds are of importance in production of a new crop and as food for both people and livestock.)
XII. Asexual reproduction

A. Reproduction by vegetative propagation
   1. Uses plant parts such as leaves, roots and stems to start new plants
   2. No new genetic material introduced--the offspring will be identical to parents

B. Methods
   1. Cuttings
      a. Stem cuttings using a tip (straight) cutting
      b. Leaf cuttings using a leaf section, leaf petiole or by cutting the veins
      c. Root cuttings using a cutting of the root and planting it
   2. Layering--Rooting a stem at the node
      (Note: Grape layering to replace a vine or strawberries' natural runners are examples of layering.)
   3. Separation--Removing corms or bulbets from the parent bulb plant (for example: an iris)
   4. Division--The removal of new shoots with some root from below
      (Note: This is used on dahlias.)
   5. Grafting--Involves the transfer of wood with buds from one plant and matching up its cambium layer to another plant. The ends then grow together, resulting in a plant having desirable qualities of both parent plants

XIII. Parts of a complete flower (Transparency 12)

A. Pistil--Female part where egg cell originates
   1. Stigma--Upper part of pistil that catches pollen
   2. Style--Supports stigma
   3. Ovary--Produce ovules which develop into seeds

B. Stamen--Male part of flower
   1. Filament--Supports anther
   2. Anther--Bears the pollen
C. Accessory organs
   1. Corolla--Petals of the flower
   2. Calyx--Sepals of the flower
   3. Pedicel--Stalk of an individual flower

XIV. Types of flowers
   A. Complete--Has stamens, pistils, petals and sepals on same flower; common to dicots
   B. Incomplete--Has stamens and pistils, but no petals or sepals; common to monocots
   C. Perfect flower--Has both stamens and pistils on the same flower
   D. Imperfect flower--Has either stamens or pistils, but not both on the same flower
   E. Staminate--Has only male flower parts
   F. Pistillate--Has only female flower parts
   G. Monoecious--Staminate and pistillate flowers found on the same plant
      (Examples: Corn, cucumbers, squash, melons and pumpkins)
   H. Dioecious--Staminate and pistillate flowers found on separate plants
      (Examples: Holly, date, palm, spinach and asparagus)

XV. Types of pollination (Transparency 13)
   A. Self-pollination--Transfer of pollen from the anthers to the stigma of the same flower on the same plant
   B. Cross-pollination--Transfer of pollen from the anthers of one plant to the stigmas of another plant
      (Note: Cross-pollination usually requires an insect or bee to transfer the pollen from one plant to the other.)
Primary Parts of a Plant

Flowers

Leaves

Stem

Soil surface

Roots
Functions of Leaves, Stems, Roots, and Flowers

Female Flower Functions:

- a. Reproduction
- b. Store food - in seeds and fruits

Male Flower Function:

- a. Pollination

Stem Tissue Functions:

- a. Conducts water and raw minerals from soil to leaves
- b. Conducts manufactured food from leaves to other plant parts
- c. Produces leaves and displays them to light
- d. Supports leaves, flowers, and fruit
- e. Stores food reserves in some plants - Irish potato, asparagus, cabbage hearts, etc.

Leaf Functions:

- a. Photosynthesis
- b. Transpiration
- c. Food storage in some crops, i.e. lettuce, cabbage

Root Functions:

- a. Absorb water and raw minerals
- b. Anchor plant
- c. Store food reserves - in some crops carrots, beets, turnips
Types of Root Systems

TAPROOT
Carrot

FIBROUS ROOT
Grass

TAPROOT

*More efficient use of sunlight by a crop plant will result in higher yields, if other factors are not limiting.
PLANT GROWTH VARIANCE WITH TEMPERATURE CHANGE

Plants die above this temperature
Above 130° the enzyme systems break down — no growth

Maximum temperature for corn and most plants — growth slows
Best range for most crop growth

Base temperature for corn

Base temperature for many plants
Below this temperature the enzyme systems are inactive — no growth

Freezing

FAHRENHEIT
Rate of Photosynthesis and Respiration as Affected by Temperature

TM 12
1. Match terms associated with plant growth and development to the correct definitions. Write the correct numbers in the blanks.

   a. Union of the male (pollen) nucleus with the female (egg) cell  
   b. Plant having two seed leaves  
   c. The part of a stem between two nodes  
   d. Vascular tissue that transports water and minerals from the root system to the leaves  
   e. The embryonic root  
   f. Seed bearing organ of a flower; composed of ovary, style and stigma  
   g. Plant having one seed leaf  
   h. The part of a stem where a leaf is attached  
   i. An embryonic shoot of a plant  
   j. The part of the embryo above the cotyledons and below the next leaves  
   k. A scar left on the stem when a leaf falls  
   l. Transfer of pollen from the anther to the stigma  
   m. The young plantlet within the seed  
   n. The part of an embryo between the cotyledons and the radicle  
   o. Part of the flower which produces the pollen; composed of the filament and anther  
   p. A strand of tissue containing xylem and phloem enclosed by a sheath of cells
A spot within a leaf scar left by the vascular bundles when a leaf falls

Vascular tissue that conducts food from the leaves to regions of growth or storage

2. Name the three stages of plant growth and development.
   a. __________________________________________________________________________
   b. __________________________________________________________________________
   c. __________________________________________________________________________

3. Name three requirements for good seed germination.
   a. __________________________________________________________________________
   b. __________________________________________________________________________
   c. __________________________________________________________________________

4. Select from the following list factors that cause poor seed germination. Write an "X" in the blank before each correct answer.
   ___ a. Number of seeds per pound
   ___ b. Seeds planted too deeply in soil
   ___ c. Presence of hardpan in root zone
   ___ d. Fungal disease
   ___ e. Low soil temperature
   ___ f. Low soil moisture
   ___ g. Damaged seed
   ___ h. Deficiency of nutrients in soil
   ___ i. Period of time between harvesting and planting of seed
   ___ j. Conditions under which seed is stored
5. Label the primary parts of a plant. Write the correct names in the blanks.

   a. __________________________
   b. __________________________
   c. __________________________
   d. __________________________

6. Match the primary plant part to its correct function. Write the correct numbers in the blanks.

   _____ a. Absorb water and nutrients; anchor and support the plant; site of food storage in carrots
   1. Roots
   2. Stems
   _____ b. Site of photosynthesis; necessary for transpiration; site of food storage in lettuce
   3. Leaves
   4. Flowers
   _____ c. Support leaves and flowers; conduct water, nutrients and food; site of food storage in potatoes
   _____ d. Site of reproduction; site of food storage in apples

7. Name two types of root systems.
   a. ________________________________________________
   b. ________________________________________________

8. Label the parts of a stem. Write the correct names in the blanks.

   a. __________________________
   b. __________________________
   c. __________________________
   d. __________________________
   e. __________________________
   f. __________________________
9. Match the stem modification with the correct description. Write the correct numbers in the blanks.

   _____ a. Enlarged fleshy part found at the tip of a rhizome; potato
            1. Crown
   _____ b. Appears laterally on branches of fruit trees and bears fruit; apple
            2. Stolon
   _____ c. Short disc-shaped stem surrounded by leaf-like scales; onion
            3. Spur
   _____ d. Fleshy, short underground stem with very few buds; gladiolus
            4. Rhizome
   _____ e. Runners that grow along top of soil surface; strawberry
            5. Tuber
   _____ f. Underground stems that grow horizontally below soil surface; quackgrass
            6. Corm
   _____ g. Appears just above or just below ground level from which modified stems grow; wheat
            7. Bulb

10. Select from the following list conditions affecting the vegetative growth of crop plants. Write an “X” in the blank before each correct answer.

   _____ a. Soil fertility
   _____ b. Amount of erosion
   _____ c. Depth seed is planted
   _____ d. Amount of rainfall
   _____ e. Presence of weeds
   _____ f. Soil moisture
   _____ g. Crop being produced
   _____ h. Presence of insects
   _____ i. Soil compaction
   _____ j. Presence of disease

11. Name two means of reproduction in plants.

   a. __________________________________________
   b. __________________________________________
12. Label the parts of a complete flower. Write the correct names in the blanks.

a. 

b. 

c. 

d. 

e. 

f. 

g. 

13. Match the type of flower to the correct description. Write the correct numbers in the blanks.

_____a. Has only male flower parts 1. Complete

_____b. Has stamens and pistils, but no petals or sepals; common to monocots 2. Incomplete

_____c. Staminate and pistillate flowers found on the same plant; corn 3. Perfect

_____d. Has both stamens and pistils on the same flower 4. Imperfect

_____e. Has only female flower parts 5. Staminate

_____f. Staminate and pistillate flowers found on separate plants; spinach 6. Pistillate

_____g. Has stamens, pistils, petals and sepals on the same flower; common to dicots 7. Monoecious

_____h. Has either stamens or pistils, but not both on the same flower 8. Dioecious

14. Match the types of pollination to the correct description. Write the correct numbers in the blanks.

_____a. Transfer of pollen from the anthers to the stigma of the same flower on the same plant 1. Self-pollination

_____b. Transfer of pollen from the anthers of one plant to the stigmas of another plant 2. Cross-pollination
PLANT GROWTH AND DEVELOPMENT

ANSWERS TO TEST

1. a. 13  f. 11  k. 4  p. 8  
b. 7  g. 6  l. 14  q. 5  
c. 2  h. 1  m. 15  r. 10  
d. 9  i. 3  n. 17  
e. 16  j. 18  o. 12

2. Seed germination and seedling growth; Vegetative; Reproduction

3. Proper temperature; Sufficient moisture; Ample supply of oxygen

4. b, d, e, f, g, i, j

5. a. Roots  c. Leaves  
b. Stem  d. Flowers

6. a. 1  b. 3  c. 2  d. 4

7. Tap root system; Fibrous root system

8. a. Node  d. Lateral bud  
b. Internode  e. Leaf scar  
c. Terminal bud  f. Vascular bundle scar

9. a. 5  d. 6  g. 1  
b. 3  e. 2  
c. 7  f. 4

10. a, b, d, e, f, g, h, i, j

11. Sexual; Asexual

12. a. Stigma  e. Petal  
b. Anther  f. Style  
c. Filament  g. Ovary  
d. Sepal

13. a. 5  e. 6  
b. 2  f. 8  
c. 7  g. 1  
d. 3  h. 4

14. a. 1  b. 2
CROP AND WEED IDENTIFICATION
AG 150 - J

UNIT OBJECTIVE
After completion of this unit, students should be able to match terms and definitions and identify the parts of a leaf, flower and stem. Students should also be able to classify plants and identify common crop and weed plants. This knowledge will be demonstrated by completion of the unit test with a minimum of 85 percent accuracy.

SPECIFIC OBJECTIVES AND COMPETENCIES
After completion of this unit, the student should be able to:

1. Match terms associated with crop and weed identification to the correct definitions.
2. Arrange in order the binomial system of plant classification.
3. Label a drawing showing the parts of a simple leaf.
4. Label a drawing showing the parts of a compound leaf.
5. Identify three types of leaf arrangements.
6. Identify the four types of leaf veination.
7. Identify three types of leaf margins.
8. Identify four types of leaf attachment to the stem.
9. Label a drawing showing the parts of a stem.
10. Label a drawing showing the parts of a complete flower.
11. Identify four types of inflorescence.
12. Name three natural resources crops and weeds are in competition for.
13. Name three losses caused by weeds.
14. Select ways that weeds spread.
15. Select methods of cultural weed control.
16. Select methods of mechanical weed control.
17. Match the classifications of herbicides to the correct description.
18. Discuss biological weed control.
19. Identify weed seeds as either prohibitive noxious or restricted noxious.
CROP AND WEED IDENTIFICATION

AG 150 - J

SUGGESTED ACTIVITIES

I. Suggested activities for instructor

A. Order materials to supplement unit.

1. Literature

   a. *Crop Plants*, 80-page manual, color photos and descriptions; available from Vocational Agriculture Service, University of Illinois, 1401 S. Maryland Dr., Urbana, Illinois 61801; approximate cost $12.00.

   b. *Weed Plants*, 80-page manual, color photos and descriptions; available from Vocational Agriculture Service, University of Illinois, 1401 S. Maryland Dr., Urbana, Illinois 61801; approximate cost $12.00.

   c. *Weeds*, instructional unit; available from Agri-Farm Publications, Inc., 1019 Market Street, Gowrie, Iowa 50543; approximate cost $17.50; order no. 209.

2. Filmstrips, slideshows, etc.

   a. *Agricultural Weed Identification*, 40 slides; available from VEP, Cal Poly State University, San Luis Obispo, California 93407; approximate cost $25.25.

   b. *An Aid to Identifying 70 Crop and Weed Plants*, slides, script and manual; available from Ohio Agricultural Education Curriculum Materials Center, Ohio State University, Columbus, Ohio 43210; approximate cost $23.00; order no. 1005M, 1006S.

   c. *Crop Seed Identification*, 105 slides and cassette, 28 minutes; available from Hobar Publications, 1234 Tiller Lane, St. Paul, Minnesota 55112; approximate cost $41.60; order no. D1.

   d. *Fundamentals of Plant Identification*, slides and manual; available from Ohio Agricultural Education Curriculum Materials Center, Ohio State University, Columbus, Ohio 43210; approximate cost $8.50; order no. 1008M, 1009S.

   e. *Identification of Weed Seedling - Broadleaf*, filmstrip or slide set; available from Vocational Agriculture Service, University of Illinois, 1401 S. Maryland Dr., Urbana, Illinois 61801; 2 parts.

   f. *Identification of Weed Seedling - Grasses*, filmstrip or slide set; available from Vocational Agriculture Service, University of Illinois, 1401 S. Maryland Dr., Urbana, Illinois 61801.
g. *Plant and Seed Identification*, slide set or video; available from Department of Agricultural Education, University of Idaho, Moscow, Idaho 83843, (208-885-6358).

h. *Seedling Identification of Legume Plants*, 24 slides and cassette; available from Hobar Publications, 1234 Tiller Lane, St. Paul, Minnesota 55112; approximate cost $31.20; order no. D6.

i. *Weed Identification*, filmstrip or slide set; available from Vocational Agriculture Service, University of Illinois, 1401 S. Maryland Dr., Urbana, Illinois 61801.

j. *Weeds and Weed Seed Identification*, 29 slides and cassette; available from Hobar Publications, 1234 Tiller Lane, St. Paul, Minnesota 55112; approximate cost $120.64; order no. D2.

k. *Weed Seed Identification Kit*, 30 weed seeds in plastic holders on 3" x 5" cards; available from IAVIM, 208 Davidson Hall, Iowa State University, Ames, Iowa 50011; approximate cost $12.50; order no. 450.

B. Make transparencies and necessary copies of materials.

C. Provide students with objective sheet and discuss.

D. Provide students with information sheet and discuss.

E. Invite county weed supervisor to speak on noxious weed laws, identification and control.

F. Tour county with students, parents, etc. to determine the status of noxious and common weeds in your locality.

G. Have a weed collection and identification contest. Have students collect pressed samples of weeds, identify them and submit to the instructor. The student with the largest number of different weed/crop specimens wins. Save the collected samples for future classroom use.

H. Invite a county agent, seed specialist or other qualified person to speak to class on economics of weeds and weed control.

I. Assign students or let them select an agronomic crop, identify problem weeds for that crop, and develop a weed control plan to use.

J. Review and give test.

K. Reteach and retest if necessary.

II. Instructional materials

A. Objective sheet

B. Suggested activities
C. Information sheet
D. Transparency masters
   1. TM 1--Binomial System of Plant Classification

CROP AND WEED IDENTIFICATION
AG 150 - J

INFORMATION SHEET

I. Terms and definitions

A. Weed--Any plant that interferes with human affairs

B. Noxious weed--Any plant which is determined by a state agency to be injurious to public health, crops, livestock, land or other property

C. Shrub--A woody perennial plant smaller than a tree and usually with several basal stems

D. Herb--A plant with no persistent woody stem above ground

E. Vine--A plant that climbs on some support, the stem cannot stand upright by itself

F. Tree--A perennial woody plant of considerable stature at maturity with a main trunk

G. Rosette--A dense, basal cluster of leaves arranged in a circular fashion like the leaves of the common dandelion

H. Prostrate--Lying flat on the ground

I. Evergreen--Bearing green leaves throughout the year

J. Deciduous--Plants that shed their leaves annually

K. Alternate--Not opposite, one leaf at a node

L. Opposite--Leaves two at a node and situated across the stem from each other

M. Simple leaf--Of only one part; leaf not completely divided into separate segments

N. Compound leaf--A leaf completely separated into two or more leaflets

O. Midrib--The main or central rib of a leaf

P. Vein--Threads of vascular tissue in a leaf

Q. Blade--The expanded, usually flat portion of a leaf or petal

R. Petiole--The stalk of a leaf blade or compound leaf

S. Pinnate--Compound leaf with the leaflets on opposite sides

T. Internode--The part of a stem between two nodes
U. Node--The place on a stem where one or more leaves are attached

II. The binomial system of plant classification (Transparency 1)

(Note: Several hundred thousand species of plants exist in the world. Botanists have chosen to organize, classify and group plants according to what they think has been their evolutionary development, with related plants near and unrelated plants far apart.)

A. Division--A group of related classes
B. Class--A group of related orders
C. Order--A group of related families
D. Family--A group of related genera
E. Genus--A group of related species
F. Species--The plants of one kind

Example:

<table>
<thead>
<tr>
<th>Category</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Division</td>
<td>Anthophyta</td>
<td>Vascular plants with seeds and flowers; ovules enclosed in an ovary; pollination indirect; the angiosperms</td>
</tr>
<tr>
<td>Class</td>
<td>Monocotyledonae</td>
<td>Embryo with one cotyledon; flower parts usually in threes; many scattered vascular bundles in stem</td>
</tr>
<tr>
<td>Order</td>
<td>Commelinales</td>
<td>Monocots with fibrous leaves; reduction and fusion in flower parts</td>
</tr>
<tr>
<td>Family</td>
<td>Poaceae</td>
<td>Hollow stemmed monocots with reduced greenish flowers; fruit a specialized achene; the grasses</td>
</tr>
<tr>
<td>Genus</td>
<td>Zea</td>
<td>Robust grasses with separate staminate and pistillate flower clusters</td>
</tr>
<tr>
<td>Species</td>
<td>Zea Mays</td>
<td>Corn</td>
</tr>
</tbody>
</table>
III. Parts of a simple leaf  (Transparency 2)
   A. Blade
   B. Veins
   C. Petiole
   D. Stipules

IV. Parts of a compound leaf  (Transparency 3)
   A. Leaflet
   B. Veins
   C. Petiolule
   D. Rachis
   E. Petiole
   F. Stipules

V. Types of leaf arrangement  (Transparency 4)
   A. Alternate
   B. Opposite
   C. Whorled

VI. Types of leaf veination  (Transparency 5)
   A. Parallel
   B. Pinnate
   C. Palmate
   D. Netted

VII. Types of leaf margins  (Transparency 6)
   A. Entire--No teeth or lobes on margin
   B. Serrate--Toothed with teeth directed forward
   C. Incised--Toothed with sinuses deeper than teeth
   D. Lobed--Margin cut in about one-half way to midrib; sinuses and tips of segments rounded
VIII. Types of leaf attachment to the stem (Transparency 7)

A. Petiolate--Leaf attached by a petiole
B. Sessile--Leaf without a petiole; blade attached to stem
C. Clasping--Sessile leaf with the lower edges of the blade partly surrounding the stem
D. Decurrent--Point of attachment extends downward on the stem

IX. Parts of a stem (Transparency 8)

A. Node
B. Internode
C. Terminal bud
D. Lateral bud
E. Leaf scar
F. Vascular bundle scar

X. Parts of a complete flower (Transparency 9)

A. Stamen--Male part of the flower producing the pollen
   1. Anther--Bears the pollen
   2. Filament--Supports the anther
B. Pistil--Female part of the flower producing the egg
   1. Stigma--Upper part of pistil that catches pollen
   2. Style--Supports stigma
   3. Ovary--Produces ovules which develop into seeds
C. Accessory parts
   1. Corolla--Petals of the flower
   2. Calyx--Sepals of the flower
   3. Pedicel--Stalk of an individual flower

XI. Types of inflorescence (Transparencies 10, 11)

A. Spike--Flowers sessile along the main axis
B. Raceme--Flowers single on pedicels along the rachis
C. Panicle--Two or more flowers on each pedicel, arranged along rachis
D. Corymb--A raceme with lower pedicels elongated and rachis shortened
E. Umbel--Pedicel of each flower attaches to a common point
F. Compound umbel
G. Head--Dense cluster of flowers
H. Solitary--Flowers borne singly, not in clusters

XII. Weed competition with crops
A. Competition for water
B. Competition for nutrients
C. Competition for light

(Note: Crops and weeds have the same basic requirements for normal growth and development. In a mixed community of crops and weeds, the more aggressive species will dominate.)

XIII. Losses caused by weeds

(Note: Losses from weeds exceed losses by any other agricultural pest. One estimate put the total loss from weeds in the U.S. at $15 billion per year, or $6000 per year per farm.)
A. Decreased crop yields
B. Decreased crop quality
C. Cost of control activities

XIV. How weeds spread
A. Wind
B. Flowing water
C. Animals and manure
D. Impure seed
E. Farm machinery, cars, pickups and trucks
F. Earth moving equipment
G. Wild flower pickers
XV. Methods of cultural control

A. Weed-free crop seed--Planting only crop seeds that have been cleaned to remove weed seeds

B. Smother crops--Crops that are highly competitive with weed species for light, nutrients and water
   (Note: Examples are small grains, grasses and alfalfa.)

C. Crop rotation--Prevent or reduce the build up of certain weeds common to a particular crop

XVI. Methods of mechanical control

A. Hand pulling--Best adapted to small areas for control of annual and biennial weeds

B. Hoeing--Best adapted for small areas for control of annual, biennial and perennial weed seedlings

C. Mowing--Prevent seed production and restrict rank weed growth

D. Cultivation--Kill weeds by cutting off tops, burying or removing from soil

E. Mulching--Smother plants to cut off sunlight

F. Burning

XVII. Classification of herbicides

A. Herbicide selectivity
   1. Selective--Used to kill weeds without significant damage to crop
   2. Non-selective--Kill all plants present if applied at an adequate rate

B. Mode of herbicide action
   1. Contact--Kills only part of plant to which it is applied; not translocated
   2. Systemic--Absorbed by roots or foliage and translocated throughout plant

C. Time of application
   1. Preplant--Applied to soil before crop is planted
   2. Preemergence--Applied prior to emergence but after crop planting
   3. Postemergence--Applied after emergence of the crops or weeds
XVIII. Biological weed control--Involves the introduction of a natural enemy to weaken or destroy a particular weed species; insects have achieved the most success, but microorganisms, parasitic plants, animals, birds and fish are also used. The goal is not eradication, but reduction of the weed population to an acceptable level.

Example: Leafcutting beetles to control St. Johnswort

XIX. Plants of economic impact to Idaho

A. Crops

Alfalfa       Red Clover
Alsike Clover Rye
Beans         Six Row Barley
Birdsfoot Trefoil Smooth Brome Grass
Club Wheat    Strawberry Clover
Common Wheat  Sugar beet
Crested Wheat Grass Sweet Clover
Kentucky Bluegrass Tall Fescue
Lentils        Tall Oat grass
Oats           Timothy
Orchard Grass  Two Row Barley
Peas           White Clover
Potatoes

B. Weeds

Barnyard Grass Mallow
Black Medic     Mayweed
(Yellow Trefoil) (Dog Fennel)
Black Mustard   Meadow Salsify
(Brown Goatsbeard)
Broadleaf Plantain Medusahead
Buckhorn Plantain Musk Thistle
Bull Thistle    Nut Sedge
Burdock         (Yellow Nut Sedge)

UNIT TEST

Name ________________________________________  Score _______________________________

1. Match terms associated with the identification of plants and weed pests to the correct definitions. Write the correct numbers in the blanks.

_____ a. The part of a stem between two nodes 1. Weed

_____ b. Not opposite; one leaf at a node 2. Noxious weed

_____ c. A plant with no persistent woody stem above ground 3. Shrub

_____ d. Any plant that interferes with human affairs 4. Herb

_____ e. The expanded, usually flat portion of a leaf 5. Vine

_____ f. The main or central rib of a leaf 6. Tree

_____ g. Lying flat on the ground 7. Rosette

_____ h. A plant that climbs on some support, the stem cannot stand upright by itself 8. Prostrate

_____ i. A leaf completely separated into two or more leaflets 9. Evergreen

_____ j. Leaves two at a node and situated across the stem from each other 10. Deciduous

_____ k. A perennial woody plant of considerable stature at maturity with a main trunk 11. Alternate

_____ l. Compound leaf with the leaflets on opposite sides 12. Opposite

_____ m. Place on a stem where leaves are attached 13. Simple leaf

_____ n. Any plant which is determined by a state agency to be injurious to public health, crops, livestock, land or other property 14. Compound leaf

_____ o. A dense, basal cluster of leaves arranged in a circular fashion 15. Midrib

_____ p. Of only one part; leaf not completely divided into separate segments 16. Vein

_____ q. The stalk of a leaf blade or compound leaf 17. Blade

_____ r. Blade

_____ s. Petiole

_____ t. Pinnate

_____ u. Internode

_____ v. Node
r. Bearing green leaves throughout the year
s. A woody perennial plant smaller than a tree
t. Plants that shed their leaves annually
u. Threads of vascular tissue in a leaf

2. Arrange in order the binomial system of plant classification. Write a "1" before the first step, a "2" before the second step, and so on.
   a. Order
   b. Species
   c. Class

   c. ________________

12. Name three natural resources crops and weeds are in competition for.
   a. __________________________
   b. __________________________
   c. __________________________

13. Name three losses caused by weeds.
   a. __________________________
   b. __________________________
   c. __________________________
14. Select from the following list ways that weeds spread. Write an "X" in the blank before each correct answer.

_____ a. Irrigation water
_____ b. Livestock
_____ c. Manure
_____ d. Wildflower gatherers
_____ e. Farm machinery
_____ f. Wind
_____ g. Fill soil
_____ h. Planting of weed seed

15. Select from the following list methods of cultural weed control. Write an "X" in the blank before each correct answer.

_____ a. Cultivation
_____ b. Crop rotation
_____ c. Burning
_____ d. Smother crops
_____ e. Use of selective herbicide
_____ f. Use of weed-free crop seed

16. Select from the following list methods of mechanical weed control. Write an "X" in the blank before each correct answer.

_____ a. Crop rotation
_____ b. Discing
_____ c. Burning
_____ d. Use of contact herbicide
_____ e. Use of weed-free crop seed
_____ f. Mowing
_____ g. Mulching
_____ h. Hoeing
17. Match the classifications of herbicides to the correct description. Write the correct numbers in the blanks.

_____a. Kills only part of plant to which it is applied; not translocated

1. Selective

_____b. Applied to soil before crop is planted

2. Non-selective

_____c. Absorbed by roots or foliage and translocated throughout plant

3. Contact

_____d. Kills all plants present if applied at an adequate rate

4. Systemic

_____e. Applied after emergence of the crops or weeds

5. Preplant

_____f. Applied prior to emergence but after crop planting

6. Preemergence

_____g. Used to kill weeds without significant damage to crop

7. Postemergence

18. Discuss biological weed control.

_____________________________________________________________________________

_____________________________________________________________________________

_____________________________________________________________________________

_____________________________________________________________________________

_____________________________________________________________________________

_____________________________________________________________________________

19. Identify the following weed seeds as either prohibitive noxious weed seeds or restricted noxious weed seeds. If the seed is prohibitive noxious, write an "X" in the blank. If it is restricted noxious, write an "O" in the blank.

_____a. Hoary Cress  

X

_____b. Spotted Knapweed

O

_____c. Dodder

O

_____d. Canada Thistle

O

_____e. Buckhorn Plantain

O

_____f. Quackgrass

O

_____g. Blue Lettuce

O

_____h. Medusahead Rye

O
i. Russian Knapweed
j. Dalmation Toadflax
k. Field Bindweed
l. Yellow Starthistle
m. Perennial Sowthistle
n. Goatgrass
CROP AND WEED IDENTIFICATION

AG 150 - J

ANSWERS TO TEST

1. a. 20  g. 8  m. 21  s. 3
   b. 11  h. 5  n. 2  t. 10
   c. 4  i. 14  o. 7  u. 16
   d. 1  j. 12  p. 13
   e. 17  k. 6  q. 18
   f. 15  l. 19  r. 9

2. a. 3  d. 5
   b. 6  e. 1
   c. 2  f. 4

3. a. Stipules
   b. Petiole
   c. Veins
   d. Blade

4. a. Leaflets  d. Petiolule
   b. Veins  e. Petiole
   c. Rachis  f. Stipules

5. a. Alternate  b. Opposite  c. Whorled

6. a. Parallel  c. Netted
   b. Pinnate  d. Palmate

7. a. Entire  b. Serrate  c. Incised  d. Lobed

8. a. Petiolate  c. Clasping
   b. Sessile  d. Decurrent

9. a. Node  d. Lateral bud
   b. Internode  e. Leaf scar
   c. Terminal bud  f. Vascular bundle scar

10. a. Stigma  d. Sepal  g. Ovary
    b. Anther  e. Petal
    c. Filament  f. Style

11. a. Spike  c. Umbel
     b. Raceme  d. Head

12. Water; Nutrients; Light

13. Decreased crop yields; Decreased crop quality; Cost of control activities

14. a, b, c, d, e, f, g, h
15. b, d, f

16. b, c, f, g, h

17. a. 3 e. 7
    b. 5 f. 6
    c. 4 g. 1
    d. 2

18. Biological weed control--Involves the introduction of a natural enemy to weaken or destroy a particular weed species; insects have achieved the most success, but microorganisms, parasitic plants, animals, birds and fish are also used. The goal is not eradication, but reduction of the weed population to an acceptable level.

19. a. X e. O i. X m. X
    b. X f. X j. X n. X
    c. O g. O k. X
    d. X h. O l. X
UNIT OBJECTIVE

After completion of this unit, students should be able to list ways that insects cause losses to crops, as well as their beneficial effects. Students should also be able to identify the body regions of an insect and classify insects according to feeding habits. This knowledge will be demonstrated by completion of the unit test with a minimum of 85 percent accuracy.

SPECIFIC OBJECTIVES AND COMPETENCIES

After completion of this unit, the student should be able to:

1. Match terms associated with insect pests of crops to the correct definition.
2. Name three ways insects cause losses to crops.
4. Discuss the economic importance of insect control.
5. Label a drawing showing the body regions of an insect.
6. Name two characteristics, which aid in distinguishing one insect from another.
7. Name three identifying characteristics of mites, ticks and spiders.
8. Match the insect feeding habit to the correct description.
9. Label a drawing showing the three and four stage life cycles of insects.
10. Select cultural control practices for insects.
11. Select biological control practices for insects.
12. Select chemical control practices for insects.
13. Match classifications of insecticides to the correct description.
SUGGESTED ACTIVITIES

I. Suggested activities for instructor

A. Order materials to supplement unit.

1. Literature

   a. *Insect Identification Manual*, available from VEP, Cal Poly State University, San Luis Obispo, California 93407; approximate cost $8.25.

   b. *Insect Pest Identification of Corn, Soybeans and Alfalfa*, 50-page manual; available from Vocational Agriculture Service, University of Illinois, 1401 S. Maryland, Urbana, Illinois 61801; approximate cost $3.50.

   c. *Insect Pests of Field Crops and Stored Grains*, manual; available from Ohio Agriculture Education Curriculum Materials Center, Ohio State University, Columbus, Ohio 43210; approximate cost $4.00; order no. 1016M.

2. Filmstrips, slideshows, etc.

   a. *Identification and Control of Common Crop Insects*, 49 slides and cassette; available from Hobar Publications, 1234 Tiller Lane, St. Paul, Minnesota 55112; approximate cost $62.40; order no. D12.

   b. *Identifying Common Insect Pests*, filmstrip or slide set, cassette and study guide; available from Vocational Agriculture Service, University of Illinois, 1401 S. Maryland, Urbana, Illinois 61801.

B. Make transparencies and necessary copies of materials.

C. Provide students with objective sheet and discuss.

D. Provide students with information sheet and discuss.

E. Review and give test.

F. Reteach and retest if necessary.

II. Instructional materials

A. Objective sheet

B. Suggested activities

C. Information sheet
D. Transparency masters
   1. TM 1--Insects Cause Losses to Crops
   2. TM 2--Insect Damage
   3. TM 3--Adult Insects
   4. TM 4--Wings and Mouthparts
   5. TM 5--Mite, Tick and Spider
   6. TM 6--Insect Classification According to Feeding Habits
   7. TM 7--Four Stage Life Cycle
   8. TM 8--Three Stage Life Cycle

INSECT PESTS OF CROPS
AG 150 - K

INFORMATION SHEET

I. Terms and definitions

A. Insect--Small, boneless animal whose body is divided into three sections and has six legs

B. Spider--A small, eight-legged animal having a body composed of two divisions (cephalothorax and abdomen); the spider is an arachnid, not an insect

C. Mite--Any of a large number of tiny arachnids, many of which live as parasites upon plants

D. Entomology--A branch of science that deals with the study of insects

E. Life cycle--Stages in the life development of an insect

F. Metamorphosis--A change in form, either gradual or sudden

G. Complete metamorphosis--Having four distinct growth stages in development in which a major change in structure and appearance of the insect occurs; each feeding life stage may eat different diets and occupy different environments

H. Incomplete metamorphosis--Gradual change in appearance as growth proceeds; the immature forms are called nymphs and eat the same as the adults

I. Larva--Immature form of an insect having complete metamorphosis

J. Pupa--Stage between the larva and adult in insects with complete metamorphosis

K. Cocoon--A silken case inside which the pupa is formed

L. Nymph--The immature stage of an insect with incomplete metamorphosis

M. Damage--Associated with crop loss and/or reduction in crop yield or crop quality

N. Injury--Deviation from normal appearance of the plant, from which it may recover and not depress yield and/or quality

O. Pesticide--Chemical used to control pests

P. Insecticide--A pesticide used to kill or control insects

Q. Acaricide--Pesticide used to kill or control mites, ticks and spiders
II. Ways insects cause losses to crops (Transparencies 1, 2)
   A. Reduce crop yield
   B. Reduce quality of the crop
   C. Cost of control practices
   D. Transmit plant diseases
      (Note: Insects may cause damage or injury depending on seriousness of infestation and the effectiveness of control measures.)

III. Beneficial effects of insects
   A. Carry pollen for pollination, which is essential to seed production of many crops
   B. Natural enemies, which control pest insects
   C. Production of useful products
      1. Honey
      2. Beeswax
      3. Silk

IV. Economic importance of insect control
   A. $1 billion spent annually on insect control
   B. $5 billion estimated losses
   C. Estimated 5% - 10% of total crop damaged
   D. Over $100 million spent yearly on cotton alone

V. Body regions of an insect (Transparency 3)
   A. Head--Bears one pair of antennae and mouth parts
   B. Thorax--Bears three pairs of legs and often bears wings
   C. Abdomen--Has as many as eleven segments, but never bears legs
      (Note: Characteristics common to all adult insects include six jointed legs and three body regions.)

VI. Characteristics, which distinguish one insect from another (Transparency 4)
   A. Wings
      (Note: Some insects have no wings; others have two or four. The wings vary in shape, size, thickness and structure.)
B. Mouthparts

(Note: Insects with chewing mouthparts have toothed jaws that bite and tear the food. Insects with piercing-sucking mouthparts have tube-like beaks which they force into a plant to suck out fluids.)

VII. Characteristics of mites, ticks and spiders (Transparency 5)
A. Eight jointed legs
B. Two body regions
C. No wings

VIII. Insect classification by feeding habits (Transparency 6)
A. Chewing

(Note: These insects bite off, chew and swallow plant parts. This results in ragged, deformed or stunted plants that may be more susceptible to disease and may die due to excessive damage.)
1. Grasshopper
2. Armyworm
3. Potato beetle
4. Blister beetle

B. Sucking

(Note: These insects pierce the outer layer of the plant tissue with their "coke straw" beak and feed on the plant sap.)
1. Aphid
2. Leafhopper
3. Thrips
4. Hessian Fly
5. Greenbug

C. Internal (borers and miners)

(Note: This group includes mostly chewing insects that enter the plant and feed from within.)
1. European corn borer
2. Cotton boll weevil larva
3. Wheat stem sawfly

D. Subterranean

(Note: This group includes both chewing and sucking insects, which enter the plant below the soil surface.)

1. Corn rootworm
2. Wireworm

IX. Life cycles of insects

(Note: Because insects live inside a chitinous exoskeleton, which cannot be expanded as they grow, they progress by a series of molts, splitting and casting off the old shell. Between the time the insect pulls free from its old covering and before the new form is solidified, there is a chance for expansion in size. There may be 3, 4, 5 or even 20 molts depending on the species. The adult insect never increases in size; growth is always in the immature life stage.)

A. Four stage group (complete metamorphosis) (Transparency 7)

(Note: Insects in this group include beetles, flies, moths, bees and butterflies.)

1. Egg
2. Larva
3. Pupa
4. Adult

B. Three stage group (incomplete metamorphosis) (Transparency 8)

(Note: Insects in this group include grasshoppers, aphids, termites, dragonflies and mayflies.)

1. Egg
2. Nymph
3. Adult

X. Cultural control practices for insects

A. Crop rotation

B. Trap crops

(Note: Small plots of a host plant the insect favors near susceptible crop. After insects have been attracted to the "trap", they can be killed by burning or with an insecticide.)

C. Tillage
D. Residue management

(Note: Shredding and incorporating of crop residue helps eradicate plant-borne insects.)

E. Timing of operations

(Note: Proper timing of planting or harvesting operations can be used to control insect damage if the host plant is resistant or susceptible for a brief period or if the damaging stage of the insect's life cycle is out of synchronization with the plant's development.)

F. Resistant varieties

(Note: This involves selection of plants less damaged by the insects and plants that are more vigorous so it is better able to resist insect attacks.)

XI. Biological control practices for insects--Natural enemies to a particular insect

(Note: The use of natural enemies, for example: predators, parasites and insect disease, sometimes can be used to control a pest.)

XII. Chemical control practices for insects

(Note: Chemicals may be applied to seeds, growing plants or soil. Effectiveness depends on the characteristics of the chemical, susceptibility of the insect, plus the timing and method of application.)

A. Poison the insects

B. Repel the insects from specific areas

C. Attract insects to a place where they can be killed

XIII. Classifications of insecticides

A. Fumigant poison--Enters the insect's body through the respiratory system in the form of a gas

B. Stomach poison--Eaten and digested by the insect

C. Contact poison--Absorbed through the insect's skin or body wall and acts upon the pest's nervous system
Insects Cause Losses to Crops

Reduce Quality of the Crop

Transmit Plant Disease

Reduce Crop Yield

Cost of Control Activities
Insect Damage

- Lacebug
- Shoot Moth Larva

UNIT TEST

Name ___________________________  Score _______________________________

1. Match terms associated with insect pests of crops to the correct definition. Write the correct numbers in the blanks.

   _____ a. A change in form, either gradual or sudden 1. Insect
   _____ b. A silken case inside which the pupa is formed 2. Spider
   _____ c. Stages in the development of an insect 3. Mite
   _____ d. Chemical used to control pests 4. Entomology
   _____ e. Any of a large number of tiny arachnids, many of which live as parasites upon plants 5. Life cycle
   _____ f. Immature form of an insect having complete metamorphosis 6. Metamorphosis
   _____ g. Associated with crop loss and/or reduction in crop yield or crop quality 8. Incomplete metamorphosis
   _____ h. A branch of science that deals with the study of insects 9. Larva
   _____ i. A small, eight legged arachnid having a body composed of two divisions 10. Pupa
   _____ j. Gradual change in appearance as growth proceeds 11. Cocoon
   _____ k. Stage between the larva and adult in insects with complete metamorphosis 12. Nymph
   _____ l. A pesticide used to kill or control insects 14. Injury
   _____ m. Having four distinct growth stages in development in which a major change in structure and appearance of the insect occurs 15. Pesticide
   _____ n. The immature stage of an insect with incomplete metamorphosis 16. Insecticide
   _____ o. Deviation from normal appearance of the plant, from which it may recover and not depress yield and/or quality 17. Acaricide
**Pesticide used to control mites, ticks and spiders**

**Small, boneless animal whose body is divided into three sections and has six legs**

2. Name three ways insects cause losses to crops.
   
   a. __________________________________________________________________________
   
   b. __________________________________________________________________________
   
   c. __________________________________________________________________________

3. Select from the following list beneficial effects of insects. Write an "X" in the blank before each correct answer.
   
   _____ a. Silk production
   
   _____ b. Spread plant disease
   
   _____ c. Lower crop quality
   
   _____ d. Natural enemies of harmful insects
   
   _____ e. Honey
   
   _____ f. Pollination

4. Discuss the economic importance of insect control.

   __________________________________________________________
   
   __________________________________________________________
   
   __________________________________________________________
   
   __________________________________________________________
   
   __________________________________________________________
   
   __________________________________________________________
5. Label the body regions of an insect. Write the correct names in the blanks.

a. 

b. 

c. 

6. Name two characteristics, which aid in distinguishing one insect from another.

a. 

b. 

7. Name three identifying characteristics of mites, ticks and spiders.

a. 

b. 

c. 

8. Match the insect feeding habit to the correct description. Write the correct numbers in the blanks.

_____ a. This group includes mostly chewing insects that enter the plant and feed from within; European corn borer

1. Chewing

2. Sucking

_____ b. These insects pierce plant tissue with their "coke straw" beak and feed on plant fluids; aphids

3. Internal

4. Subterranean

_____ c. These insects bite off, chew and swallow plant parts; potato beetle

_____ d. This group includes both chewing and sucking insects which feed on the plant below the soil surface; wireworm
9. Label the life cycles of insects. Write the correct names in the blanks.

Four Stage Life Cycle

b. __________________

c. __________________

d. __________________

e. __________________

Three Stage Life Cycle

f. __________________

g. __________________

10. Select from the following list cultural control practices for insects. Write an "X" in the blank before each correct answer.

_____ a. Discing under grain stubble

_____ b. Crop rotation

_____ c. Use of natural enemies to control insects

_____ d. Application of insecticides

_____ e. Trap crops

_____ f. Use of crop varieties resistant to insects

_____ g. Proper timing of planting or harvesting operations

11. Select from the following list biological control practices for insects. Write an "X" in the blank before each correct answer.

_____ a. Application of pesticide to infected area

_____ b. Discing under grain stubble

_____ c. Proper timing of tillage operations

_____ d. Use of resistant crop varieties

_____ e. Shredding of crop residue

_____ f. Use of natural enemies
12. Select from the following list chemical control practices for insects. Write an "X" in the blank before each correct answer.

____ a. Application of malathion to control aphids
____ b. Crop rotation
____ c. Soil application of Temik to control potato insects
____ d. Trap crops to attract insects
____ e. Insecticide application to infected crop
____ f. Use of resistant crop varieties

13. Match classifications of insecticides to the correct description. Write the correct numbers in the blanks.

____ a. Eaten and digested by the insect
____ b. Enters through the respiratory system in the form of a gas
____ c. Absorbed through the skin or the body wall of the insect and acts upon the pest's nervous system

1. Fumigant poison
2. Stomach poison
3. Contact poison
## ANSWERS TO TEST

1. a. 6   f. 9   k. 10   p. 17  
   b. 11  g. 13  l. 16  q. 1  
   c. 5   h. 4   m. 7   
   d. 15  i. 2   n. 12  
   e. 3   j. 8   o. 14  

2. Answer should include three of the following: 
   - Reduce crop yield; 
   - Reduce crop quality; 
   - Cost of control activities; 
   - Transmit plant disease

3. a, d, e, f

4. Answer may include information from the following: 
   - $1 billion spend annually on insect control; 
   - $5 billion estimated losses; 
   - Estimated 5% - 10% of total crop damaged; 
   - Over $100 million spent yearly on cotton alone

5. a. Head  
   b. Thorax  
   c. Abdomen

6. Wings; Mouthparts

7. Eight jointed legs; two body regions; No wings

8. a. 3   b. 2   c. 1  d. 4

9. a. Egg  e. Egg  
   b. Larva f. Nymph  
   c. Pupa  g. Adult  
   d. Adult

10. a, b, e, f, g

11. f

12. a, c, e

13. a. 2   b. 1   c. 3
UNIT OBJECTIVE

After completion of this unit, students should be able to match terms and definitions, list the five groups of biological pathogens and discuss methods of prevention and control of plant disease. This knowledge will be demonstrated by completion of the unit test with a minimum of 85 percent accuracy.

SPECIFIC OBJECTIVES AND COMPETENCIES

After completion of this unit, the student should be able to:

1. Match terms associated with plant disease to the correct definitions.
2. Name three ways diseases cause economic loss in plants.
3. List the five groups of biological pathogens.
4. Match the two types of fungi to the correct description.
5. List three methods by which pathogens spread.
6. Match the general approaches to disease control to the correct descriptions.
7. List three primary disease control methods available to the farmer.
8. Select practices used to control plant diseases.
9. Select diseases caused by fungal infection.
10. Select diseases caused by bacterial infection.
11. Select diseases caused by viral infection.
12. Select diseases caused by nematode infection.
13. Select diseases caused by mycoplasm infection.
SUGGESTED ACTIVITIES

I. Suggested activities for instructor
   A. Order materials to supplement unit.
      1. Literature
         a. *Field Crop Diseases*, manual available from Ohio Agriculture Education Curriculum Materials Center, Ohio State University, Columbus, Ohio 43210; approximate cost $3.00; order no. 1017M.
      2. Filmstrips, slideshows, etc.
         a. *Symptomology and Control of Common Crop Disease*, 107 slides and cassette; available from Hobar Publications, 1234 Tiller Lane, St. Paul, Minnesota 55112; approximate cost $145.60; order no. D12.
   B. Make transparencies and necessary copies of materials.
   C. Provide students with objective sheet and discuss.
   D. Provide students with information sheet and discuss.
   E. Invite local extension agent or crop specialist to speak to class on local diseases and control practices.
   F. Review and give test.
   G. Reteach and retest if necessary.

II. Instructional materials

PLANT DISEASE IDENTIFICATION AND CONTROL

AG 150 - L

INFORMATION SHEET

I. Terms and definitions

A. Plant disease--An abnormal plant condition caused by a pathogen or improper environmental condition

B. Pathogen--A disease-producing agent

C. Host--Plant that is susceptible to a pathogen

D. Fungi--Small filamentous organisms that lack chlorophyll and which cause rots, mildews and other diseases

E. Bacteria--A single-celled microscopic organism

F. Nematode--Tiny, tubular, unsegmented, eel-like worms that feed on plant parts

G. Nematicide--Pesticide used to control nematodes

H. Virus--A submicroscopic entity consisting of nucleic acids and amino acids capable of causing mosaic and other diseases

I. Blight--Rapid discoloration and death of tissue over certain portions of the plant

J. Fungicide--Chemical or biological material used to kill or destroy fungi

K. Resistant--Inherited ability of a plant to retard growth of disease-causing organisms

L. Scab--Crust-like, diseased lesion produced as a result of disease infection

M. Lesion--A localized area of discolored diseased tissue

N. Wilt--Loss of freshness and drooping leaves

O. Gall--Knob on the plant parts produced by certain nematodes, bacteria or fungi causing stunting, chlorosis, necrosis, malformations and may result in reduction of yield or quality

P. Chlorosis--Loss of green color (yellowing or whitening) in foliage

Q. Symptom--Evidence or indicator of disease; reaction of a plant to a pathogen

R. Necrosis--Death of plant parts

S. Sign--Visible evidence of the pathogen
II. Diseases cause economic loss in plants
   A. Reduced yield
   B. Reduced crop quality
   C. Spoilage in storage and transportation
   D. Render food unfit for use
   E. Cost of control activities

III. Groups of biological pathogens (Transparency 1)
   A. Fungi
   B. Bacteria
   C. Virus and viroids
   D. Nematodes
   E. Mycoplasmas

IV. Types of fungi
   A. Saprophytic fungi--Fungi that live on dead or decaying organic matter
      (Note: They are important because they eventually release the nutrients they take
      from dead plants and animals, thus contributing to soil fertility. Some species,
      such as mushrooms and truffles, are edible and of considerable economic
      importance.)
   B. Parasitic fungi--Fungi that live on or in a living host plant; may be obligate or
      non-obligate parasites
      (Note: About 7500 parasitic fungi are of economic importance because of the
      damage and yield reduction in affected crops.)

V. Means by which pathogens spread (Transparency 2)
   A. Wind
   B. Rain
   C. Insects, mites
   D. Machinery
VI. General approaches to disease control  (Transparency 3)

(Note: Satisfactory control of most plant diseases requires the application of several control measures and usually involves an integrated program of environmental, biological and chemical factors. Correct diagnosis is essential to plant disease control. Then, control involves the application of one or more of the following principles.)

A. Avoidance--Avoiding disease by planting when and/or where pathogens are ineffective or absent

B. Exclusion--Keeping pathogens out of a "clean" area

C. Eradication--Eliminating the pathogen source, whether an infected plant, field or region

D. Protection--Preventing an infection by using a chemical or physical barrier to keep pathogens out

E. Resistance--Using plants that tolerate, resist or are immune to the disease

F. Therapy--Reducing the severity of disease in an infected plant

VII. Primary disease control methods available to the farmer

A. Cultural practices

(Note: Crop management to minimize development of disease is the oldest and most applicable approach. A pathogen and its host must be brought together under proper environmental conditions for a disease to develop. Cultural practices are used to alter the environment, the condition of the host or the behavior of the pathogen to prevent an infection.)

B. Control through disease resistance

(Note: Resistant varieties have been one of the major factors in maintaining high levels of crop productivity in the United States. For many diseases of forage and field crops with relatively low values per acre, chemical controls often cannot be used because the profit margin is too low. For these cases, resistant varieties provide the only means of ensuring continued protection.)

C. Chemical control

(Note: The use of fungicides is dependent on the crop, the disease and the specific conditions for use. For specific recommendations, contact your county extension agent or chemical supplier. For best results, the chemicals should be used with other control methods in a planned strategy.)

VIII. Practices used to control plant diseases

A. Use of resistant varieties

B. Eradication of alternate host plants

C. Treatment of soil
D. Rotation of crops
E. Destruction of plant residue
F. Use of disease-free seed
G. Applications of fungicides

IX. Diseases caused by fungal infection (Transparencies 4, 5)
A. Rusts--Wheat, oats, barley, rye
B. Powdery mildew--Grains, legumes
C. Downey mildew--Grains, alfalfa, onions, cucumbers
D. Smuts--Corn, wheat, oats, barley, grasses
E. Ergot--Rye, wheat, barley and other grasses
F. Scab--Barley, wheat, rye
G. Seed decay, damping off, root rots--All plants
H. Wilts--Potatoes, alfalfa, trees
I. Soft rots, dry rots--Fleshy organs, potatoes, onions, carrots, etc.
J. Scab--Potatoes
K. Cankers--Woody plants

X. Diseases caused by bacterial infection (Transparencies 6, 7)
A. Bacterial wilts--Corn, alfalfa, potatoes
B. Galls--Crown gall on many crops, trees
C. Leaf spot--Cotton, beans, peas, trees
D. Blights--Vegetable crops, fruit trees
E. Cankers--Woody plants
F. Soft rots--Fleshy or succulent plant parts

XI. Diseases caused by viral infection (Transparency 8)
A. Mosaic--Tomatoes, potatoes, beans, corn, small grains, forage, legumes, peas, sugar beets, cucurbits
B. Curly top--Tomato, beans, sugar beets
C. Yellows--Barley yellow dwarf, potato leaf roll, sugar beet yellows

XII. Diseases caused by nematode infections (Transparency 9)
   A. Galls--Root-knot nematodes; over 2,000 hosts
   B. Hairy root--Cyst nematodes; sugar beets, soybeans, potatoes
   C. Root lesions--Lesion nematodes; over 2,000 hosts
   D. Necrosis, stunting--Foliar nematodes; alfalfa, clover, onions

XIII. Diseases caused by mycoplasmas
   A. Aster yellows--Several hosts
   B. Pear decline--Pears
   C. Western X--Stone fruit trees
Biological Pathogens

1. Fungi
2. Bacteria
3. Virus and viroids
4. Nematodes
5. Mycoplasmas
Means by Which Pathogens Spread

Wind

Insects

Rain

Machinery
Symptoms of Diseases

- Powdery Mildew
- Shoot Blight
- Fruit Rot
- Conker
- Wilt
- Twig Blight
- Leaf Spots
- Crown Galls
- Root Knots
- Root Rot
Fungi

Wilt - Caused by Fungi entering root and stem

Rust on cotton

Leaf spot - or early blight

Soil rot in wet soil
Fungi

Young plant roots destroyed by fungi

Cotton root rot

Rust fungus on grass
BACTERIAL DISEASES

BACTERIAL SPOT ON TOMATO

BACTERIAL BLIGHT ON COTTON BOLLS

STALK ROT DISEASE IN CORN PLANT
Bacterial Diseases

A localized area of discolored diseased tissue
Rapid discoloration and death of tissue over certain portions of the plant
Plant that is susceptible to a pathogen

2. Name three ways diseases cause economic loss in plants.
   a. ____________________________________________________________
   b. ____________________________________________________________
   c. ____________________________________________________________

3. Name the five groups of biological pathogens.
   a. ____________________________________________________________
   b. ____________________________________________________________
   c. ____________________________________________________________
   d. ____________________________________________________________
   e. ____________________________________________________________

4. Match the types of fungi to the correct description. Write the correct numbers in the blanks.
   _____ a. Fungi that live on dead or decaying organic matter
            1. Saprophytic fungi
            2. Parasitic fungi
   _____ b. Fungi that live on or in a living host plant

5. Name three methods by which pathogens spread.
   a. ____________________________________________________________
   b. ____________________________________________________________
   c. ____________________________________________________________

6. Match the general approaches to disease control to the correct descriptions. Write the correct numbers in the blanks.
   _____ a. Eliminating the pathogen source, whether an infected plant, field or region
            1. Avoidance
            2. Exclusion
            3. Eradication
   _____ b. Reducing the severity of disease in an infected plant
   _____ c. Keeping pathogens out of a "clean" area
            4. Protection
d. Using plants that tolerate, resist or are immune to the disease

e. Avoiding disease by planting when and/or where pathogens are ineffective or absent

f. Preventing an infection by using a chemical or physical barrier to keep pathogens out

7. Name three primary disease control methods available to the farmer.

a._________________________________________________________________________

b._________________________________________________________________________

c._________________________________________________________________________

8. Select from the following list practices used to control plant diseases. Write an "X" in the blank before each correct answer.

a. Application of fungicides

b. Use of disease-free seed

c. Burning stubble

d. Destruction of crop residue

e. Rotation of crops

f. Discing grain stubble

g. Treatment of soil

h. Eradication of alternate host plants

i. Use of resistant varieties

9. Select from the following list diseases caused by fungal infection. Write an "X" in the blank before each correct answer.

a. Bacterial blight

b. Dry rots

c. Mosaic

d. Seed decay

e. Ergot

f. Rusts
10. Select from the following list diseases caused by bacterial infection. Write an "X" in the blank before each correct answer.
   _____ a. Smuts
   _____ b. Galls
   _____ c. Cankers
   _____ d. Hairy root
   _____ e. Curly top
   _____ f. Bacterial wilts

11. Select from the following list diseases caused by viral infection. Write an "X" in the blank before each correct answer.
   _____ a. Mosaic
   _____ b. Curly top
   _____ c. Yellows
   _____ d. Hairy rot
   _____ e. Powdery mildew
   _____ f. Blights

12. Select from the following list diseases caused by nematode infection. Write an "X" in the blank before each correct answer.
   _____ a. Rusts
   _____ b. Pear decline
   _____ c. Root lesions
   _____ d. Western X
   _____ e. Mosaic
   _____ f. Hairy root
   _____ g. Necrosis
13. Select from the following list diseases caused by mycoplasm infection. Write an "X" in the blank before each correct answer.

_____ a. Aster yellows

_____ b. Downey mildew

_____ c. Western X

_____ d. Blights

_____ e. Pear decline

_____ f. Root lesions
PLANT DISEASE IDENTIFICATION AND CONTROL

AG 150 - L

ANSWERS TO TEST

1. a. 15  f. 16  k. 4  p. 8  b. 10  g. 18  l. 7  q. 13  c. 5  h. 12  m. 14  r. 9  d. 2  i. 1  n. 19  s. 3  e. 11  j. 17  o. 6

2. Answer should include three of the following:
   Reduced yield; Reduced crop quality; Spoilage in storage and transportation; Render food unfit for use; Cost of control activities

3. Fungi; Bacteria; Virus and viroids; Nematodes; Mycoplasmas

4. a. 1  b. 2

5. Answer should include three of the following:
   Wind; Rain; Insects, mites; Machinery

6. a. 3  d. 5  b. 6  e. 1  c. 2  f. 4

7. Cultural practices; Control through disease resistance; Chemical control

8. a, b, d, e, g, h, i

9. b, d, e, f

10. b, c, f

11. a, b, c

12. c, f, g

13. a, c, e
CROP CHEMICALS

AG 150 - M

UNIT OBJECTIVE

After completion of this unit, students should be able to discuss proper and improper use of pesticides and how they affect the environment; identify available formulations, calculate amounts of pesticide to apply, list and discuss factors that affect application of chemicals and discuss safety practices in relation to prevention of accidents using crop chemicals. This knowledge will be demonstrated by completion of assignment sheets and unit test with a minimum of 85 percent accuracy.

SPECIFIC OBJECTIVES AND COMPETENCIES

After completion of this unit, the student should be able to:

1. Match terms associated with crop chemicals to the correct definitions.
2. List two functions of agricultural chemicals.
3. Name three main groups of pests.
4. Match pesticides with the pests controlled.
5. Select results of discontinued pesticide use.
6. Match EPA classification of pesticides to the correct definition.
7. Select resources necessary for man to exist.
8. Name two ways pesticides are beneficial to the environment.
9. Name two ways improper use of pesticides can harm the environment.
10. Select facts contained on a pesticide label.
11. Match signal words found on labels with the correct level of toxicity.
12. Match the herbicide classification with the correct description.
13. Match the types of pesticide formulations to the correct description.
14. Discuss advantages, disadvantages and principal uses of granule and wettable powder formulations.
15. Arrange in proper sequence the procedure for mixing wettable powders (dry).
16. Arrange in proper sequence the procedure for mixing emulsifiable concentrates (liquid).
17. List four safety precautions when mixing and handling pesticides.
18. Describe proper pesticide storage site, building and conditions.
19. Calculate problems determining amounts of wettable powder (dry) to use.
20. Calculate problems determining amounts of emulsifiable concentrate (liquid) to use.
21. Match methods of pesticide application to the correct description.
22. Identify the parts of a sprayer.
23. Identify the type of nozzle by its spray pattern.
24. Name two climatic factors that affect pesticide application.
25. List four factors to consider when choosing the appropriate pesticide.
26. Name the two causes of most pesticide poisonings.
27. List three ways pesticides enter the body.
28. List the most important routes of entry for applicators and small children.
29. List three steps to follow in case of pesticide poisoning.
30. Name the local hospital or poison control center that serves your area that can provide emergency treatment for pesticide poisoning.
31. Select protective clothing and equipment needed for pesticide applications.
32. Select ways to prevent exposure during application.
33. Name four methods for disposal of pesticides and pesticide containers.
34. List four reasons for keeping records of pesticide use.
35. Discuss regulations governing pesticide use.
36. Interpret pesticide labels correctly when given questions concerning pests.
CROP CHEMICALS
AG 150 - M

SUGGESTED ACTIVITIES

I. Suggested activities for instructor

A. Order materials to supplement unit.

   1. Literature

      b. Crop Chemicals, an FMO publication by John Deere; 9 chapters; available from John Deere Distribution Service Center, Service Publications, Department 150, 1400 13th Street East, Moline, Illinois 61244 (1-800-544-2122).

      c. Field Sprayer Calibration, 21 transparency masters; available from IAVIM, 208 Davidson Hall, Iowa State University, Ames, Iowa 50011; approximate cost $2.25; order no. 503.

      e. Weed Control, set of 61 transparencies; available from Vocational Agriculture Service, University of Illinois, 1401 S. Maryland, Urbana, Illinois 61801; approximate cost $19.45.

   2. Filmstrips, slideshows, etc.

      a. Agricultural Weed Control, 53-frame filmstrip; available from VEP, Cal Poly State University, San Luis Obispo, California 93407; approximate cost $27.50.

      b. Applying Pesticides Properly, color videocassettes; available from Kansas State University, Manhattan, Kansas 66506.

      c. Be A Pro: Avoid Pesticide Accidents, 79 slides with cassette and script; available from Visual Communications, 4125 Roberts Hall, Cornell University, Ithaca, New York 14853.
d. *Be a Pro with Pesticides*, 72 slides with cassette and script; available from Visual Communications, 4125 Roberts Hall, Cornell University, Ithaca, New York 14853. Used in conjunction with *Be a Pro with Pesticides*, 16mm film, 22 1/2 minutes.

e. *Crop Chemicals*, slide set available from John Deere Distribution Service Center, Service Publications, Department 150, 1400 13th Street East, Moline, Illinois 61244 (1-800-544-2122); approximate cost $124.00.

f. *Modern Agricultural Spraying Equipment*, 54-frame filmstrip with script; available from IAVIM, 208 Davidson Hall, Iowa State University, Ames, Iowa 50011; approximate cost $8.75; order no. 331.

g. *Pesticide Use Training*, 420 slides with cassettes and scripts; available from United States Environmental Protection Agency, National Audiovisual Center, Government Services Administration, Washington, DC 20409.

h. *Pesticides: Safe Handling and Use*, 6 cassettes, 6 film strips and study guide; available from Teaching Aids, Inc., P. O. Box 1798, Costa Mesa, California 92626; approximate cost $229.00; order no. B260.

i. *Proper Pesticide Use Series: Pesticides*, color videocassettes; available from Oregon State University, Corvallis, Oregon 97331.

j. *Sprayer Calibration*, 1 disk, transparency and handout masters; available from Teaching Aids, Inc., P. O. Box 1798, Costa Mesa, California 92626; approximate cost $22.00; order no. ACS-5.

B. Make transparencies and necessary copies of materials.

C. Provide students with objective sheet and discuss.

D. Provide students with information and assignment sheets and discuss.

E. Invite a resource person to visit with class concerning the importance of private pesticide applicator certification and applicable federal, state and local laws and regulations.

F. Ask students to clip magazine and newspaper articles, which demonstrate ways, that pesticides improve the environment.

G. Ask students to list the pesticides on their farms and in their homes. Have them list them according to type, such as insecticide or herbicide.

H. Invite local pest management specialist to speak to class about on-going projects. Ask the specialist to bring examples of natural enemies and beneficial plants and animals found in your area.

I. Secure pesticide labels and make them available to students.
J. Contact a trained medical person at the local hospital or poison control center that provides treatment for pesticide poisoning and ask the person to speak to the class.

K. Assemble the different types of respirators and demonstrate proper use, clean up and storage of each.

L. Assemble the basic types of protective clothing and equipment. Give students a sample label, target pest and application site and ask them to put on the necessary clothing and equipment for the job. Allow class to critique both over and under protection for the job.

M. Provide students with opportunity to practice mixing pesticides by using flour for wettable powder and oil as an emulsifiable concentrate. Use water to dilute them. DO NOT USE ACTUAL PESTICIDES!

N. Borrow equipment from local dealers or farms and allow students to practice calibrating equipment.

O. Review and give test.

P. Reteach and retest if necessary.

II. Instructional materials

A. Objective sheet

B. Suggested activities

CROP CHEMICALS
AG 150 - M

INFORMATION SHEET

I. Terms and definitions

A. Pesticide--Chemical or other substance that will prevent, repel, destroy or control a pest or protect something from a pest

B. Tolerance--Maximum amount of pesticide, which can legally remain on or in any food or feed crop at harvest or animal at slaughter

C. Certification--Recognition by certifying agency that a person is competent and thus authorized to use or supervise the use of restricted-use pesticides

D. Phytotoxicity--Causing injury to plant life

E. Hazard--Risk of danger; chance that injury or harm will come to the applicator, other persons, plants or animals

F. EPA--Environmental Protection Agency

G. Organism--Any living thing

H. Pest--An unwanted organism

I. Weed--Any plant that interferes with human affairs

J. Drift--Movement of pesticide droplets or particles by wind and air currents

K. Target--Area, building, plant, animal or pest intended to be treated with pesticide

L. Short-term (non-persistent)--Pesticide that breaks down almost immediately into non-toxic by-products

M. Residual (persistent)--Pesticide that remains in the environment for a fairly long time

N. Broad spectrum (non-selective)--Pesticide which is toxic to a wide range of pests

O. Selective--Pesticide which is more toxic to some types of plants or animals than to others

P. Active ingredient--That part of a pesticide product, which will kill or control pests or prevent damage by them
Q. LD₅₀--Lethal dose or amount of a pesticide, which would kill half a large number of test animals if eaten or absorbed through the skin

(Note: The lower the LD value, the more poisonous the pesticide. LD stands for lethal dose.)

R. Oral--Through the mouth

S. Dermal--Absorbed through the skin

T. Inhalation--Breathed in through the lungs

U. Formulation--Mixture of one or more active ingredients with other materials needed to make a pesticide easy to store, handle, dilute and apply

V. Compatible--Able to be combined with other pesticides and applied as a mixture without reducing their effectiveness

W. Dilute--To make a pesticide thinner or weaker by adding water, oil or other materials

X. Calibration--Measurement of how much pesticide will be applied by the equipment to the site; measurement of the delivery rate

II. Functions of agricultural chemicals

A. Improve crop growth

B. Protect crop against pests

III. Main groups of pests

A. Insects

B. Mites, ticks and spiders

C. Bacteria, fungi and viruses

(Note: The plant disease is not the pest; the causal agent is.)

D. Nematodes

E. Vertebrate animals, for example: rodents, coyotes, squirrels, etc.

F. Weeds

IV. Pesticides and pest controlled (Transparency 1)

A. Herbicides--Control weeds

B. Insecticides--Control insects

C. Fungicides--Control fungal diseases
D. Bactericides--Control bacterial diseases

E. Nematicides--Control nematodes

F. Acaricides--Control mites, ticks and spiders

G. Rodenticides--Control rats, mice and other rodents

V. Economic importance of pesticide use

A. Large quantity used each year

(Note: In 1980, 846 million pounds of pesticide active ingredient were used on U.S. farms--about .81 pounds per acre. These materials cost $3.6 billion, approximately $16 for every person in the U.S.)

B. Without the use of pesticides (Transparency 2)

1. Yields would be reduced
2. Food would be more expensive
3. Food would be less available
4. Food would be of lower quality
5. Labor requirements would increase
6. Exports would decrease
7. Lower standard of living
8. More of work force involved in food production

VI. EPA classifications of pesticides

(Note: EPA will classify the use of each pesticide as either general or restricted.)

A. General use--Pesticide use which will not cause excessive damage in the environment or endanger the applicator or other persons when applied according to label directions

(Note: No certification requirements are necessary on the part of the applicator.)

B. Restricted use--Pesticide use which may cause damage in the environment or endanger the applicator or other persons unless label directions are followed

(Note: Certification is necessary on the part of the applicator to purchase and apply restricted use pesticides.)
VII. Resources necessary for man to exist (Transparency 3)

(Note: The surroundings in which man lives and the resources he depends on make up his environment.)

A. Place to live
B. Clean water
C. Clean air
D. Food
E. Clean soil

VIII. Ways pesticides are beneficial to the environment

A. Enable more food to be produced on same area
B. Control plant diseases, parasites, insects and weeds
C. Control animal diseases, parasites and insects
D. Preserve outdoor activities

IX. Ways improper use of some pesticides might harm the environment

A. Cause nature imbalance
B. Pollute streams and water supply
C. Pollute crops
D. Pollute soil
E. Injure desirable plants
F. Persistent residues in food chain

(Note: For more information on chemicals and the environment, contact your local office of the Environmental Protection Agency.)

X. Facts contained on a pesticide label (Transparency 4)

A. Name and address of chemical company
B. Brand (trade) name
C. Name and amounts of all active ingredients

(Note: The label will also list the amounts of inert ingredients.)
D. Type of pesticide
E. Kind of formulation
F. EPA registration and establishment numbers
G. Storage and disposal precautions
H. Hazard statement
   (Note: This statement describes environmental hazards, human hazards, animal and plant hazards, and physical and chemical hazards.)
I. Directions for use
J. Net content
K. Words: "Keep Out of Reach of Children"
L. Signal word
M. Days to harvest or slaughter
N. Reentry interval, if applicable
O. General use or restricted use classification statement
XI. Signal words found on labels (Transparency 5)
   A. Danger--Highly toxic pesticides; the word "poison" printed in red and the skull and crossbones symbol are also required on labels of highly toxic pesticides
   B. Warning--Moderately toxic pesticides
   C. Caution--Slightly toxic to relatively non-toxic pesticides
XII. Classification of herbicides (Transparencies 6, 7, 8)
   A. Selectivity
      1. Selective--Use to control weeds without significant damage to the crop
      2. Nonselective--Kills all plants present if applied at adequate rates
   B. Mode of action
      1. Contact--Kills only part of plant to which it is applied; not translocated
      2. Systemic--Absorbed by roots and foliage and translocated throughout plant; kills entire plant
C. Time of application

1. Preplant--Applied to soil before crop is planted
2. Preemergence--Applied to soil prior to emergence but after the crop is planted
3. Postemergence--Applied after emergence of the crop or weed

XIII. Types of pesticide formulations (Transparency 9)

A. Granule (G)--Ready-to-use dry mixture of a small amount of active ingredient and inert carriers with all particles larger than dust particles

B. Emulsifiable concentrate (EC or E)--Solution which contains a high concentration of active ingredient which should be mixed with water; may contain from one to several pounds of active ingredient per gallon of concentrate

C. Flowable (F)--Very finely ground solid material which is suspended in a liquid; usually contains a high concentration of active ingredient and is mixed with water when applied

D. Wettable powder (WP or W)--Dry preparation which may contain a fairly high concentration (15%-95%) of active ingredient that dissolves in water to form a solution for application

E. Fumigant--Active ingredient is in the form of a gas or liquid which becomes gas when applied, and reaches the target as a gas

XIV. Advantages, disadvantages and principle uses of formulations

<table>
<thead>
<tr>
<th>Formulation</th>
<th>Advantages</th>
<th>Disadvantages</th>
<th>Principle Uses</th>
</tr>
</thead>
<tbody>
<tr>
<td>Granule</td>
<td>Ready to use; easy to apply; can be applied to target under dense foliage</td>
<td>Limited foliage use</td>
<td>Soil treatment</td>
</tr>
<tr>
<td>Emulsifiable</td>
<td>High concentration; relatively inexpensive suitable for low pressure equipment with limited agitation</td>
<td>Easy to overdose; may be hazardous to applicator; phytotoxicity; requires agitation</td>
<td>Fruits and vegetables, farm animals, field crops</td>
</tr>
<tr>
<td>Formulation</td>
<td>Advantages</td>
<td>Disadvantages</td>
<td>Principle Uses</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>----------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------</td>
<td>-------------------------------------</td>

<td>Can be mixed with water; reduces nozzle clogging</td>
<td>Requires agitation</td>
<td>Fruits and vegetables, farm animals, field crops</td>
</tr>
<tr>
<td>(a pre-wetted powder)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Wettable Powder</td>
<td>Relatively inexpensive; safer than emulsifiable concentrate to use on tender foliage; easy to measure</td>
<td>May be hazardous to applicator; requires mechanical agitation; difficult to mix; may clog nozzles; dusty</td>
<td>Fruits and vegetables, farm animals, field crops</td>
</tr>
<tr>
<td>Fumigant</td>
<td>Toxic to wide range of pests; will penetrate cracks and crevices of grain</td>
<td>Area must be sealed; requires special protective equipment; dangerous</td>
<td>Inside buildings, greenhouses, farm stored grain, soil</td>
</tr>
</tbody>
</table>

**XV. Procedure for mixing wettable powders** (Transparency 10)

A. Fill tank one-half full of water

B. Start agitator

(Note: Keep agitator going at all times.)

C. Measure out correct amount of wettable powder

D. Add powder to a small amount of water in a clean mixing bucket

E. Stir until well mixed

(Note: This will make a "slurry", a watery mixture of insoluble matter.)

F. Add slurry to tank

G. Finish filling the tank

**XVI. Procedure for mixing emulsifiable concentrates**

A. Fill tank one-fourth to one-half full with water

B. Measure out correct amount of emulsifiable concentrate (EC)

C. Add EC directly into spray tank
D. Mix thoroughly using mechanical or hydraulic agitation

(Note: Do not use air agitation.)

E. Finish filling the tank

XVII. Safety precautions when mixing and handling pesticides (Transparency 11)

A. Follow all safety precautions stated on the label

B. Use protective clothing and equipment as stated on the label

C. Rinse empty containers and measuring cups to remove any residue

D. Read the label or consult an expert to make sure mixes of two or more pesticides are compatible

E. Avoid splashes, spills and leaks

(Note: Clean up any splashes, spills or leaks.)

F. Wash all contaminated areas on clothing or equipment

G. Dispose of empty containers properly

XVIII. Pesticide storage (Transparency 12)

A. Site

1. Separate from other equipment or material storage facilities

2. Not located in flood plain

3. Spill and drainage containment for large storage facilities

B. Building

1. Fire resistant

2. Cement floor

3. Exhaust fan for ventilation

4. Well-lit

5. Locked door

6. Sufficient storage area
C. Conditions

1. Keep products off the floor
2. Store containers so that the labels remain in good condition
3. Keep pesticides dry, cool and out of direct sunlight

XIX. Determining amounts of wettable powder (dry) to use

A. Pounds per tank

1. Formula

\[
\text{tank capacity} \times \frac{\text{pounds per acre}}{\text{gallons applied per acre}}
\]

2. Problem--Label calls for 3 pounds of 25% WP per acre. Your sprayer holds 50 gallons and applies 10 gallons per acre

3. Solution

\[
\frac{50}{10} \times 3 = 15 \text{ pounds per 50 gallon tank}
\]

B. Pounds per gallon

1. Formula

\[
\frac{\text{pounds of WP}}{\text{gallons water}} \times \text{tank capacity}
\]

2. Problem--Label calls for 2 pounds of 50% WP per 100 gallons of water. Your tank holds 300 gallons

3. Solution

\[
\frac{2}{100} \times 300 = 6 \text{ lbs per 300 gallons}
\]

C. Active ingredient per acre

1. Formula

\[
\text{tank capacity} \times \frac{\text{pounds WP per acre}}{\text{gallons applied per acre}}
\]

2. Problem--A local expert recommends that you apply 1/2 pound of active ingredient per acre. You have a 50% WP on hand and your sprayer tank holds 50 gallons and applies 8 gallons per acre
3. Solution

(Given: 1 pound of 50% WP per acre = 1/2 pound of active ingredient per acre.)

\[
50 \times 1 = \frac{6.25 \text{ pounds of 50% WP per tank}}{8} \text{ to apply 1/2 pound per acre}
\]

XX. Determining amounts of emulsifiable concentrate (liquid) to use

A. Pints per gallon

1. Formula

\[
\frac{\text{Pints EC}}{\text{gallons of water}} \times \text{tank capacity}
\]

2. Problem--The label says to apply 1/4 pint of 8 EC per 100 gallons. Your tank holds 400 gallons. How much 8 EC is needed?

3. Solution

\[
\frac{1/4}{100} \times 400 = 1 \text{ pint per 400 gallons}
\]

B. Pints, quarts or gallons per acre

1. Formula

\[
\frac{\text{tank capacity}}{\text{gallons applied per acre}} \times \text{recommended amount of herbicide per acre}
\]

2. Problem--The label recommends that you apply 2 quarts of 6 EC per acre. Your sprayer holds 42 gallons and applies 6 gallons per acre

3. Solution

\[
\frac{42}{6} \times 2 = 14 \text{ quarts per tankful}
\]

C. Active ingredient per acre

1. Formula

\[
\frac{\text{tank capacity}}{\text{gallons applied per acre}} \times \text{amount EC per acre}
\]

2. Problem--A local expert recommends you apply 1/2 pound active ingredient per acre. You have 4 EC on hand which contains 4 pounds of active ingredient per gallon formulation. Your sprayer holds 40 gallons and applies 6 gallons per acre. How much 4 EC is needed to apply 1/2 pound active ingredient per acre?
3. Solution--(Given: 4 pounds of active ingredient/gallon = 4 pounds per 4 quarts = 1 pound per quart = 1/2 pound per pint.)

\[
\frac{40 \times 1 \text{ pint of 4 EC per acre}}{6} = 6 \frac{2}{3} \text{ pints per tankful}
\]

XXI. Methods of application and their descriptions  (Transparencies 13, 14)

A. Band--Application to a strip or band over or along each crop row
B. Broadcast--Uniform application to an entire specified area
C. Directed--Aiming the pesticide at a portion of a plant
D. Drench--Saturation of the soil with a pesticide
E. Foliar--Application to the leaves of a plant, shrub or tree
F. In-furrow--Application to or in a furrow in which a crop is planted
G. Sidedress--Application along the side of a crop row
H. Soil incorporation--Application to the soil followed by use of tillage implements to mix the pesticide with the soil
I. Spot treatment--Application to a small area

XXII. Parts of a sprayer  (Transparency 15)

A. Pump
B. Pressure regulator and gauge
C. Control valves
D. Tank
E. Agitation system
F. Booms
G. Nozzles

XXIII. Types of nozzles  (Transparency 16)

A. Solid stream--Compact jet used in handguns to spray a distant target or fixed to apply a narrow band or to inject into the soil
B. Regular flat fan--Narrow oval pattern with lighter edges; used for broadcast spraying
C. Flooding flat fan--Wide angle spray pattern; used for broadcast spraying
D. Hollow cone--Circular pattern with little or no spray in the center; used for spraying foliage
E. Solid cone--Circular pattern (full); used for spraying foliage

XXIV. Climatic factors that affect pesticide application

A. Soil moisture
   (Note: Pesticides work best with moderate soil moisture. Wetness may keep the pesticide from contacting the soil particles.)
B. Rain
   (Note: Rain often causes pesticides to leach out of or run off the application site. It also may wash pesticides off foliage. However, preemergence herbicides and protectants or preventative fungicides are sometimes purposely applied just before or soon after rain.)
C. Humidity
   (Note: Herbicides work best when weeds are growing fast. High humidity and warm temperatures help cause this growth.)
D. Temperature
   (Note: High temperatures cause some pesticides to evaporate more quickly than is desirable. Low temperatures may slow down or stop the activity of some pesticides.)
E. Light
   (Note: Light aids in breaking down pesticides.)

XXV. Factors to consider when choosing appropriate pesticide

A. Has directions on the label for the intended use
B. Is effective against the pest
C. Will not cause injury to the plant or other surface to which it is applied
D. Will cause the least damage to beneficial organisms
E. Will not move off the treated area and into environment to harm fish and wildlife
F. Works well in the machinery available
G. Is worth the cost
   (Note: Cost of application should be compared to the increase in yield expected in the treated area.)
H. Toxicity to man, animals and other plants

XXVI. Cause of most pesticide poisoning
   A. Careless practices
   B. Ignorance

   (Note: Learn safe procedures; it is for your own good!)

XXVII. Ways pesticides enter the body (Transparency 17)
   A. Oral
   B. Dermal
   C. Inhalation

   (Note: You can be poisoned no matter which way the pesticide enters your body. It may enter and poison you through all three routes of entry at the same time.)

XXVIII. Most important routes of entry for pesticides
   A. Applicator--Dermal and inhalation
   B. Small children--Oral and dermal

XXIX. Steps to follow in case of pesticide poisoning
   A. Check to see if patient is breathing
   B. Call doctor or take victim to doctor or hospital
   C. Locate pesticide label and have available for doctor

XXX. Local hospital or poison control center that serves your area and that can provide emergency treatment for pesticide poisoning
   A. City __________________ Address _______________________________ 
   B. Telephone: Area Code______ Number _______________________________

   (Note: Make sure your doctor has the number of the poison control center.)
XXXI. Protective clothing and equipment needed for pesticide applications (Transparency 18)

(Note: Use protective clothing and equipment called for on the label.)

A. Gloves
   1. Obtain unlined, elbow length neoprene or natural rubber gloves
      (Note: Some chemicals will dissolve rubber or make it sticky.)
   2. Make sure sleeves are outside your gloves
      (Note: This should be done unless spraying overhead.)
   3. Discard the gloves if any holes appear
   4. Wash gloves with detergent and water before removing
      (Caution: Never use cotton or leather gloves unless specified on the label. These can be more hazardous than no protection at all because they hold the pesticide close to your skin.)

B. Coveralls
   1. Wear clean tightly woven fabric coveralls that cover entire body or long sleeved shirt and long legged trousers
      (Note: Most applicators who apply pesticides regularly have special coveralls kept just for pesticide applications.)
   2. Wear waterproof suit or apron when mixing highly toxic pesticides
   3. Wear waterproof suit when you may be drenched during application
   4. Wash clothes with detergent and water

C. Boots
   1. Wear lightweight, unlined neoprene or natural rubber boots
      (Note: Boots should cover your ankles.)
   2. Put pant legs outside of boots
      (Note: This will keep pesticide from draining into boot.)
   3. Wash and dry boots inside and out after each use

D. Goggles and face shield
   1. Wear tight-fitting goggles or a face shield when pesticide spray or dust could get on your face or in your eyes
2. Wear goggles or face shield when pouring and mixing

3. Wash goggles and face shield after each use

E. Head and neck covering
   1. Protect hair and skin on neck from pesticide spray
   2. Wear waterproof wide-brimmed hat or hard hat
      (Note: In cool weather, a hooded waterproof parka and a bill cap are also good.)

XXXII. Ways to prevent exposure during application

A. Wear protective clothing and equipment

B. Do not wipe hands on clothing
   (Note: Carry a special towel for wiping hands.)
   (Caution: Do not wipe gloves on your clothing, especially if chemicals are on gloves. Your clothing can become contaminated and the chemicals may soak through to your skin.)

C. Never blow out clogged hoses, nozzles or lines with your mouth

D. Never eat, drink or smoke when handling pesticides

E. Work in pairs when handling hazardous pesticides or at least let someone know where you will be working

F. Keep persons, livestock and pets out of spray area
   (Note: When working with pesticides day after day, even moderately toxic chemicals can poison you. Wear protective equipment, especially a respirator.)
   (Caution: Do not let children or pets play around sprayers, dusters, filler tanks, storage areas or old pesticide containers. Use proper rates. Overdose won't kill a pest twice, but may injure humans, crops or wildlife.)

XXXIII. Methods of disposal of pesticides and pesticide containers (Transparencies 19, 20)

A. Open burning
   (Note: Check local regulations. In some areas burnable containers may be burned on the farm in small quantities, usually the amount emptied in one day. Never burn containers, which held 2, 4-D, type herbicides because the smoke could injure sensitive plants.)
B. Burial

(Note: Many landfills will accept triple-rinsed pesticide containers, especially if broken, crushed or cut apart. Otherwise, the burial site should be selected in an area where water will not be contaminated and where public health and the environment will not be harmed. Do not bury pesticides and unrinsed pesticide containers that contain mercury, lead, cadmium, arsenic or inorganic pesticides unless they are encapsulated. Some landfills will take these containers if they have been triple rinsed.)

C. Recycling

(Note: Some non-burnable containers, such as plastic and steel drums, may be returned to the manufacturer for reuse.)

D. Incineration in a special pesticide-approved incinerator

(Note: Some pesticides and pesticide containers may be made harmless using this method. However, this method may not be used for pesticides or pesticide containers with mercury, lead, cadmium, arsenic or inorganic pesticides.)

E. Chemical degradation

(Note: Sometimes pesticides can be chemically broken down into non-toxic materials. These methods are specific for each chemical and cannot be described here. Check with the manufacturer or local Environmental Protection Agency officials for specific methods.)

F. Soil injection

(Note: Use soil injection methods only when recommended by state or federal regulatory officials.)

G. Encapsulation

(Note: This is usually the only method of disposal of pesticides or unrinsed containers with mercury, lead, cadmium, arsenic or inorganic pesticides.)

XXXIV. Reasons for keeping records of pesticide use (Transparency 21)

A. Help in finding an error if an error is made

B. Provide information to trace residue and/or damage problems

C. Help save money

D. Allow one to compare the results obtained from different pesticides

E. Help to reduce pesticide misuse

F. Provide guide to buying specific amount of pesticide needed

G. Establish proof of proper use in damage suit
XXXV. Regulations governing pesticide use

A. Applicator must be licensed to apply restricted-use pesticides

B. Custom applicator license required if applying chemical to land farmed by someone else

ASSIGNMENT SHEET #1--INTERPRET PESTICIDE LABELS

Name ______________________________________________  Score ______________________

Read the label provided on the following page and answer the questions below.

1. What type of pest does this pesticide control?

2. Is this a short-term (nonpersistent) or residual (persistent) pesticide? Why?

3. What type of formulation is DeMetho?

4. Who was the manufacturer?

5. What is the percentage of active ingredients?

6. How much pesticide does this container hold?

7. What signal word is on this label?

8. What toxicity category does it represent?

9. What protective clothing would you wear?

10. Does this formulation go on as is or must it be diluted? If diluted, with what?

11. How should you store this container?

12. How do you dispose of this container?
RESTRICTED USE PESTICIDE

FOR RETAIL SALE TO AND APPLICATION ONLY BY CERTIFIED APPLICATORS OR PERSONS UNDER THEIR DIRECT SUPERVISION

DE METHO
INSECTICIDE
Emulsifiable Concentrate

ACTIVE INGREDIENTS: METHYLMEVALONATE 24%
INERT INGREDIENTS: 76%
TOTAL: 100%

Net Content: 50 gallons

This product contains 150 lbs. of DE METHO per gallon

Regis trademark of A Z CORPORATION

KEEP OUT OF REACH OF CHILDREN
DANGER – POISON

STATEMENT OF PRACTICAL TREATMENT

IF SWALLOWED: Induce vomiting by giving 1 tablespoonful of water or milk. Follow with one glass of water. Give 1 oz. liquid Pepsin solution or 1 Tbsp. mustard powder. Call a physician immediately.

IF IN EYES: Flush with plenty of water for at least 15 minutes. Keep eyelids open and under running water.

IF ON SKIN OR CLOTHING: Remove contaminated clothing and wash skin with soap and water. See side panel for additional precautionary statements.

EPA REGISTRATION NO. 1357-43
ASSIGNMENT SHEET #2--CALCULATE SPRAY MATERIALS USING WETTABLE POWDER

Name ______________________________  Score __________________

Calculate the problems below and show your work.

1. How much wettable powder is needed to make 200 gallons of spray if recommended rate is 3 pounds per 50 gallons of water?

2. How many pounds of wettable powder are needed to make 100 gallons of spray if 3 pounds of 60% wettable powder is needed per acre and your sprayer applies 25 gallons per acre?

3. A farmer wants to spray a field of corn. The recommended strength of the spray is 0.5%. The wettable powder recommended is 50% and the spray tank holds 150 gallons. How much 50% WP is required for this mix?

\[
\text{Gallons of spray wanted} \times \% \text{ active ingredient needed} \times 8.3 \text{ pounds/gallon} \\
\% \text{ active ingredient in pesticide used}
\]
CROP CHEMICALS
AG 150 - M

ASSIGNMENT SHEET #3--CALCULATE SPRAY MATERIALS USING EMULSIFIABLE CONCENTRATE

Name ______________________________________________  Score ______________________

Calculate the problems below and show your work.

1. How many quarts of 6EC are needed to mix 40 gallons if recommended amount is 2 quarts per acre and your sprayer applies 4 gallons per acre?

2. How many pints of 8EC are needed for 400 gallons of spray if recommended rate is 1/2 pint per 100 gallons of water?

3. A farmer wants to mix 200 gallons of 0.3% spray using 50% emulsifiable concentrate (4 pounds pesticide per gallon). How many gallons of concentrate will be needed?

Gallons of spray wanted $\times$ % active ingredient $\times$ 8.3 pounds per gallon

Pounds of active ingredient per gallon of concentrate $\times$ 100
Assignment Sheet #1

1. Insects

2. Relatively short term; because it can be applied fairly close to harvest date and contains no other precautions on persistence

3. Emulsifiable concentrate

4. A-Z chemicals

5. 24%

6. 50 gallons

7. Danger (poison, skull and crossbones)

8. Highly toxic

9. Closely woven fabric coveralls

10. Diluted with water

11. In original container in a dry, locked pesticide storage area away from food, feed and livestock

12. Triple rinse, crush and bury in a safe place or in a local landfill, if legal

Assignment Sheet #2

1. 12 pounds

2. 12 pounds

3. 12.45 pounds or 12 1/2 pounds

Assignment Sheet #3

1. 20 quarts

2. 2 pints

3. 1.25 gallons

</table>
1. Pesticide that breaks down almost immediately into non-toxic by-products

2. That part of a pesticide product which will kill or control pests or prevent damage by them

3. Breathed in through the lungs

4. To make a pesticide thinner or weaker by adding water, oil or other materials

5. Mixture of one or more active ingredients with other materials needed to make a pesticide easy to store, handle, dilute and supply

6. Recognition by certifying agent that a person is competent and thus authorized to use or supervise the use of restricted-use pesticides

7. Pesticide which is toxic to a wide range of pests

8. Movement of pesticide droplets or particles by wind and air currents

2. List two functions of agricultural chemicals.
   a. ___________________________________________________________________________
   b. ___________________________________________________________________________

3. Name three main groups of pests.
   a. ___________________________________________________________________________
   b. ___________________________________________________________________________
   c. ___________________________________________________________________________

4. Match the pesticide with the pest it controls. Write the correct numbers in the blanks.
   ____a. Nematode ___________________________ 1. Herbicide
   ____b. Spiders, ticks and mites ________________ 2. Insecticide
   ____c. Fungal diseases ______________________ 3. Fungicide
   ____d. Plants; mainly weeds ________________ 4. Bactericide
   ____e. Rats and mice ________________________ 5. Nematicide
   ____f. Flies and mosquitoes ________________ 6. Acaricide
   ____g. Bacterial diseases ________________ 7. Rodenticide
5. Select from the following list results of discontinued pesticide use. Write an "X" in the blank before each correct answer.

   _____a. Yields would increase
   _____b. Food would be more expensive
   _____c. Food would be more available
   _____d. Food would be of lower quality
   _____e. Labor requirements would decrease
   _____f. More of work force involved in agriculture
   _____g. Exports would increase

6. Match the EPA classification of pesticides to the correct definition. Write the correct numbers in the blanks.

   _____a. Pesticide use which will not cause excessive damage __________________________________________________________________________
      1. General use
      in the environment or endanger the applicator or other persons when applied according to label directions
   _____b. Pesticide use which may cause damage in the __________________________________________________________________________
      2. Restricted use
      environment or endanger the applicator or other persons unless label directions are followed

7. Select from the following list resources necessary for man to exist. Write an "X" in the blank before each correct answer.

   _____a. High paying job
   _____b. Clean water
   _____c. Food
   _____d. Companionship
   _____e. Clean air
   _____f. Shelter

8. Name two ways pesticides are beneficial to the environment.

   a. __________________________________________________________________________
   b. __________________________________________________________________________

9. Name two ways improper use of pesticides can harm the environment.

   a. __________________________________________________________________________
   b. __________________________________________________________________________
10. Select from the following list facts contained on a pesticide label. Write an "X" in the blank before each correct answer.

_____ a. Name of manufacturer
_____ b. Active ingredients
_____ c. Formulation
_____ d. Pest controlled
_____ e. Price
_____ f. Storage and disposal precautions
_____ g. Net content
_____ h. Signal word
_____ i. Directions for use

11. Match signal words found on labels with the correct toxicity level. Write the correct numbers in the blanks.

_____ a. Slightly toxic to relatively non-toxic pesticides 1. Danger
_____ b. Moderately toxic pesticides 2. Warning
_____ c. Highly toxic pesticides 3. Caution

12. Match the herbicide classification with the correct description. Write the correct numbers in the blanks.

_____ a. Kills only part of plant to which it is applied; not translocated 1. Selective
_____ b. Applied to soil before crop is planted 2. Nonselective
_____ c. Absorbed by roots and foliage and translocated throughout plant; kills entire plant 3. Contact
_____ d. Kills all plants present if applied at an adequate rate 4. Systemic
_____ e. Applied after emergence of the crops or weeds 5. Preplant
_____ f. Applied to soil prior to emergence but after crop planting 6. Preemergence
_____ g. Used to control weeds without significant damage to crop
13. Match the types of pesticide formulations to the correct description. Write the correct numbers in the blanks.

_____ a. Very finely ground solid material which is suspended in a liquid; usually contains a high concentration of active ingredient which should be mixed with water

_____ b. Dry preparation which may contain a fairly high concentration of active ingredient that dissolves in water to form a solution for application

_____ c. Solution which contains a high concentration of active ingredient which should be mixed with water

_____ d. Active ingredient is in the form of a gas or liquid which becomes gas when applied, and reaches the target as a gas

_____ e. Ready-to-use dry mixture of a small amount of active ingredient and inert carriers with all particles larger than dust particles

14. Discuss the advantages, disadvantages and principal uses of granule and wettable powder formulations.

_____________________________________________________________________________
_____________________________________________________________________________
_____________________________________________________________________________
_____________________________________________________________________________
_____________________________________________________________________________
_____________________________________________________________________________
15. Arrange in proper sequence the procedure for mixing wettable powders. Write a "1" before the first step, a "2" before the second step, and so on.

   _____a. Measure out correct amount of wettable powder
   _____b. Start agitator
   _____c. Finish filling the tank
   _____d. Stir until well mixed
   _____e. Fill tank one-half full of water
   _____f. Add slurry to tank
   _____g. Add powder to a small amount of water in a clean mixing bucket

16. Arrange in proper sequence the procedure for mixing emulsifiable concentrates. Write a "1" before the first step, a "2" before the second step, and so on.

   _____a. Add EC directly into spray tank
   _____b. Measure out correct amount of EC
   _____c. Mix thoroughly using mechanical or hydraulic agitation
   _____d. Fill tank one-fourth to one-half full with water
   _____e. Finish filling tank

17. List four safety precautions when mixing and handling pesticides.

   a. _____________________________________________________________
   b. _____________________________________________________________
   c. _____________________________________________________________
   d. _____________________________________________________________

18. Calculate the following problem to determine the amount of wettable powder to use. Use the following formula and show your work.

   \[
   \text{Gallons spray needed} \times \frac{\% \text{ active ingredient wanted}}{100} \times 8.3 \text{ lbs per gallon water} \times \frac{\% \text{ active ingredient in pesticide used}}{100}
   \]

   Problem: A local expert recommended using a 0.2% spray. You have on hand a 50% wettable powder of the right pesticide and you need 75 gallons of the spray. How much pesticide is needed?
19. Calculate the problem below determining the amount of emulsifiable concentrate to use. Show your work.

Problem: The label recommends using 3 pints per acre of 6EC. Your sprayer holds 60 gallons and applies 6 gallons per acre. How much 6EC is needed?

20. Match methods of pesticide application to the correct description. Write the correct numbers in the blanks.

_____ a. Uniform application to an entire specified area 1. Band
_____ b. Saturation of the soil with a pesticide 2. Broadcast
_____ c. Application to or in a furrow in which a crop is planted 3. Directed
_____ d. Aiming the pesticide at a portion of a plant 4. Drench
_____ e. Application along the side of a crop row 5. Foliar
_____ f. Application to a small area 6. In-furrow
_____ g. Application to a strip over or along each crop row 7. Sidedress
_____ h. Application to the leaves of a plant 8. Soil incorporation
_____ i. Application to the soil followed by use of tillage implements to mix the pesticide with the soil 9. Spot treatment
21. Identify the parts of a sprayer. Write the correct names in the blanks.

a. 

b. 

c. 

d. 

e. 

f. 

g. 

h. 

i. 

j. 

22. Identify the type of nozzle by its spray pattern. Write the correct names in the blanks.

a. 

b. 

c. 

d. 

e. 

f. 

g. 

h. 

i. 

j. 

k.

23. Name two climatic factors that affect pesticide application.
   a. 
   b. 

24. List four factors to consider when choosing the appropriate pesticide.
   a. 
   b. 
   c. 
   d. 

25. Name the two causes of most pesticide poisoning.
   a. 
   b. 

26. List three ways pesticides enter the body.
   a. 
   b. 
   c. 

27. List the most important routes of entry for:
   a. Applicators
   b. Small children

28. List three steps to follow in case of a pesticide poisoning.
   a. 
   b. 
   c. 

29. Name the local hospital or poison control center that serves your area that can provide emergency treatment for pesticide poisoning.

_________________________________________
30. Select from the following list protective clothing and equipment needed for pesticide application. Write an "X" in the blank before each correct answer.

   _____a. Unlined, neoprene gloves
   _____b. Tightly woven fabric coveralls
   _____c. Heavy, lined leather gloves
   _____d. Unlined, neoprene boots
   _____e. Sturdy canvas or leather boots
   _____f. Tight fitting goggles or face shield
   _____g. Pant legs on inside of boots
   _____h. Waterproof hat
   _____i. Waterproof suit when mixing highly toxic pesticides

31. Select from the following list ways to prevent exposure during application. Write an "X" in the blank before each correct answer.

   _____a. Keep livestock out of spray area
   _____b. Never eat, drink or smoke when handling pesticides
   _____c. Do not wipe hands on clothing
   _____d. Work in pairs when handling hazardous pesticides
   _____e. Never blow out clogged lines with your mouth
   _____f. Wear protective clothing and equipment

32. Name four methods for disposal of pesticides and pesticide containers.

   a. ____________________________________________
   b. ____________________________________________
   c. ____________________________________________
   d. ____________________________________________
33. List four reasons for keeping records of pesticide use.
   a. 
   b. 
   c. 
   d. 

34. Describe proper pesticide storage site, building and conditions.
   **Site**
   
   
   
   **Building**
   
   
   
   
   
   **Conditions**
   
   
   
   

35. Discuss regulations governing pesticide use.
CROP CHEMICALS
AG 150 - M

ANSWERS TO TEST

1. a. 11  g. 8  m. 9  s. 20
   b. 4  h. 15  n. 17  t. 23
   c. 18  i. 13  o. 7  u. 21
   d. 24  j. 5  p. 1  v. 3
   e. 6  k. 19  q. 12  w. 14
   f. 2  l. 22  r. 16  x. 10

2. Improve crop growth; Protect against crop pest

3. Answer should include three of the following:
   Insects; Mites, ticks and spiders; Bacteria, fungi and viruses; Nematodes; Vertebrate animals;
   Weeds

4. a. 5  e. 7
   b. 6  f. 2
   c. 3  g. 4
   d. 1

5. b, d, f

6. a. 1  b. 2

7. b, c, e, f

8. Answer should include two of the following:
   Enable more food to be produced on same area; Control plant diseases, parasites, insects and
   weeds; Control animal diseases, parasites and insects; Preserve outdoor activities

9. Answer should include two of the following:
   Cause nature imbalance; Pollute streams and water supply; Pollute crops; Pollute soil; Injure
   desirable plants; Persistent residues in food chain

10. a, b, c, d, f, g, h, i

11. a. 3  b. 2  c. 1

12. a. 3  e. 7
   b. 5  f. 6
   c. 4  g. 1
   d. 2

13. a. 3  b. 4  c. 2  d. 5  e. 1
14. Answer should include information from the following:

<table>
<thead>
<tr>
<th>Formulation</th>
<th>Advantages</th>
<th>Disadvantages</th>
<th>Principle Uses</th>
</tr>
</thead>
<tbody>
<tr>
<td>Granule</td>
<td>Ready to use; easy to apply; can be applied to target under dense foliage</td>
<td>Limited foliage use</td>
<td>Soil treatment</td>
</tr>
<tr>
<td>Wettable Powder</td>
<td>Relatively inexpensive; safer than emulsifiable concentrate to use on tender foliage; easy to measure</td>
<td>May be hazardous to applicator; requires mechanical agitation; difficult to mix; may clog nozzles; dusty</td>
<td>Fruits and vegetables, farm animals, field crops</td>
</tr>
</tbody>
</table>

15. a. 3 b. 2 c. 7 d. 5 e. 1 f. 6 g. 4

16. a. 3 b. 2 c. 4 d. 1 e. 5

17. Answer should include four of the following:

- Follow all safety precautions stated on label
- Use protective clothing and equipment
- Rinse empty containers and measuring cups
- Only mix compatible pesticides
- Avoid splashes, spills and leaks
- Wash all contaminated areas on clothing or equipment
- Dispose of empty containers properly

18. 2.5 lbs per 75 gallons of water

19. 30 pints or 15 quarts or 3 gallons and 3 quarts

20. a. 2 b. 4 c. 6 d. 3 e. 7 f. 9 g. 1 h. 5 i. 8

22. a. Solid cone  b. Hollow cone  c. Flooding flat  d. Regular flat  e. Solid Stream

23. Answer should include two of the following:

- Soil moisture
- Rain
- Humidity
- Temperature
- Light
24. Answer should include four of the following:
   - Has directions on the label for the intended use;
   - Is effective against the pest;
   - Will not cause injury to the plant or other surface to which it is applied;
   - Will cause the least damage to beneficial organisms;
   - Will not move off the treated area and into environment to harm fish and wildlife;
   - Works well in the machinery available;
   - Is worth the cost;
   - Toxicity to man, animals and other plants

25. Careless practices; Ignorance

26. Oral; Dermal; Inhalation

27. a. Dermal and inhalation
   b. Oral and dermal

28. Check to see if patient is breathing; Call doctor or take victim to doctor or hospital; Locate pesticide label and have available for doctor

29. Evaluated to satisfaction of instructor

30. a, b, d, f, h, i

31. a, b, c, d, e, f

32. Answer should include four of the following:
   - Open burning; Burial; Recycling; Pesticide-approved incinerator; Chemical degradation; Soil injection; Encapsulation

33. Answer should include four of the following:
   - Help in finding an error if an error is made;
   - Provide information to trace residue and/or damage problems;
   - Help save money;
   - Allow one to compare the results obtained from different pesticides;
   - Help to reduce pesticide misuse;
   - Provide guide to buying specific amount of pesticide needed;
   - Establish proof of proper use in damage suit

34. Answer should include the following information:
   - **Site:** Separate from other equipment or material storage facilities; Not located on flood plain; Spill and drainage containment for large storage facilities
   - **Building:** Fire resistant; Cement floor; Exhaust fan for ventilation; Well-lit; Locked door; Sufficient storage area
   - **Conditions:** Keep products off the floor; Store containers so that the labels remain in good condition; Keep pesticides dry, cool and out of direct sunlight

35. Applicator must be licensed to apply restricted-use pesticides; Custom applicator license required if applying chemical to land farmed by someone else
UNIT OBJECTIVE

After completion of this unit, students should be able to select good quality seed, list factors to consider in selecting high quality seed and conditions that exist when good seed is not selected. Students should also be able to list the certifiable seed classes, list information required on certified seed tags and calculate pure live seed. This knowledge will be demonstrated by completion of assignment sheets, laboratory exercises and unit test with a minimum of 85 percent accuracy.

SPECIFIC OBJECTIVES AND COMPETENCIES

After completion of this unit, the student should be able to:

1. Match terms associated with seed selection to the correct definitions.
2. List four factors to consider in selecting high quality seed.
3. Select conditions that exist when good seed is not selected.
4. List two means of securing good seed.
5. Arrange in order the four certifiable seed classes.
6. Select information required on certified seed tags.
7. Name three types of seed treatment.
8. Select procedures to follow in handling and storing seed.
9. Calculate the value of pure live seed.
10. Compare seed lots.
11. Conduct a warm germination test.
12. Conduct a cold germination test.
13. Conduct a TZ germination test.
SEED SELECTION
AG 150 - N

SUGGESTED ACTIVITIES

I. Suggested activities for instructor

A. Order materials to supplement unit.

1. Literature

   a. *Idaho Bean Commission*, 415 S. 13th, P.O. Box 9433, Boise, Idaho 83707.

2. Films

   a. *Certified Seed*, 13 1/2 minutes, available in Beta or VHS format; explains what certified seed is, how it is produced and what the benefits are to farmers who use it; available from University of Idaho District Extension Office; also available from Agricultural Communications Center, 10 Ag Science Building, Moscow, Idaho 83843 (208-885-6436); program #229; purchase price $25; rental price $10 for 14 days.

B. Make transparencies and necessary copies of materials.

C. Provide students with objective sheet and discuss.

D. Provide students with information and assignment sheets and laboratory exercises.

E. Discuss information and assignment sheets and demonstrate procedures outlined in laboratory exercises.

F. Review and give test.

G. Reteach and retest if necessary.

II. Instructional materials

A. Objective sheet

B. Suggested activities

C. Information sheet
D. Transparency master
   1. TM 1--Seed Label Requirements

E. Assignment sheets
   1. AS 1--Determine Seed Value
   2. AS 2--Compare Seed Lots

F. Answers to assignment sheets

G. Laboratory exercises
   1. LE 1--The Warm Germination Test
   2. LE 2--The Cold Germination Test
   3. LE 3--The TZ Germination Test

H. Test
I. Answers to test

III. Unit references

F. *Planting*, Vo-Ag I, Unit IV-F, Teaching Materials Center, Agriculture Education Department, Texas A & M University, College Station, Texas.

G. *Seed Selection*, Vo-Ag II, Unit IV, Oklahoma State Board for Vocational Technical Education, Stillwater, Oklahoma.

SEED SELECTION
AG 150 - N

INFORMATION SHEET

I. Terms and definitions

A. Seed--Plant embryo and stored food surrounded by a seed coat

B. Breeder seed--Seed or vegetatively propagated material that is controlled by the originator; initial source of seed for that variety

C. Foundation seed--Second link in the certified seed chain; produced from breeder seed and handled in such a way as to ensure genetic identity and varietal purity

D. Registered seed--Third link in the certified seed chain; seed produced from foundation seed or recertified registered seed; used to produce certified seed

E. Certified seed--Seed which is guaranteed by a state agency to meet certain minimum requirements in respect to purity, germination and other characteristics; may be progeny of foundation, registered or reregistered certified seed

F. Common seed--No minimum requirements in respect to purity, germination percentage and other characteristics; not inspected by state agency

G. Inert matter--Percentage by weight of chaff, broken seeds, stems and soil particles

H. Hard seed--Seed which remains hard at the end of the prescribed test because it has not absorbed water due to an impermeable seed coat

I. Pure live seed--Amount of seed when planted that has potential to produce plants

II. Factors to consider in selecting high quality seed

A. Purity

(Note: Good seed should be free from noxious weeds, inert matter, dirt, chaff and seeds of other crops or other varieties.)

B. Viability

(Note: Viability is determined by germination percentage and vigor index, if present. Generally, 85% germination is considered minimum. Check date on seed. If it is more than one year old, it should be retested for germination percentage. Refer to Idaho Rules of Certification for exact requirements of certified seed.)
C. Free of disease
   (Note: The great loss in using diseased seed is not in the cost of the seed, but in the cost of control measures or loss in crop produced from the disease.)

D. Free of insects

E. Size and plumpness
   (Note: Large, plump and well developed seeds contain more plant food to give the young plant a good start.)

III. Conditions that exist when good seed is not selected

A. Low germination percentage

B. Large amount of inert matter

C. Has large amount of other crop seed

D. Infested with weed seed

E. Lacks resistance to or harbors disease

F. Lacks resistance to or is infested by insects

G. Lacks adaptability to certain climatic and growing conditions

H. Fails to remain viable from harvest to planting time

IV. Means of securing good seed

A. Home grown

B. Reliable seed dealers

V. Certifiable seed classes
   (Note: Potatoes are not classified using this system.)

A. Breeder seed
   (Note: Breeder seed has the strictest requirements of classes for pest control, isolation, genetic purity and handling to prevent contamination of seed lot.)

B. Foundation seed
   (Note: Foundation seed is first to get into the hands of the grower; distribution is usually only to "select" growers in an area; progeny of breeder seed.)
C. Registered seed

(Note: Progeny of either foundation or recertified registered seed; requirements of this class are not as strict as breeder and foundation.)

D. Certified seed

(Note: Progeny of either foundation, registered or reregistered certified seed; this class has the lowest requirements of certifiable classes, but are still quite strict.)

VI. Information required on certified seed tag (Transparency 1)

A. Common name of seed represented

Example:  UI 114 - Bean

B. Percent by weight of purity

C. Percent by weight of weed seeds

D. Number of seeds per pound of noxious weeds

E. Percent germination

F. Date

VII. Types of seed treatment

A. Chemical

(Note: Most chemical seed treatments are general fungicides to control seed or soil-borne fungal seedling diseases.)

B. Pelletizing

(Note: Pelletizing seed is done mainly to make the seed size more uniform for ease of planting. Pelletizing also enhances germination, and chemicals may be added during process to aid in pest control. Some seed treatments are harmful to the inoculant.)

C. Inoculation

(Note: Legumes are able to fix atmospheric nitrogen through a symbiotic relationship with rhizobium bacteria. Inoculation is coating of the seed with this bacteria to ensure its presence in the soil.)

VIII. Procedure to follow in handling and storing seed

A. Purchase foundation, registered or certified seed for planting

B. Select clean seed

C. Control weeds
D. Prevent seed from mixing
E. Store in a cool, dry place
F. Treat seed for insects and disease
G. Protect from rodents
H. Test seed for germination
I. Inspect seed during storage
J. Make sure seed moisture is favorable for storage before harvesting home grown seed

IX. Determining the value of pure live seed

A. Using the prices and labels from two different lots of Common Bermuda grass seed, the better seed can be selected by the number of pounds of pure live seed that are in each lot and the cost per pound of each lot

1. Label information

<table>
<thead>
<tr>
<th>Lot 1</th>
<th>Lot 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Germination</td>
<td>Germination</td>
</tr>
<tr>
<td>85.00%</td>
<td>80.00%</td>
</tr>
<tr>
<td>Inert matter</td>
<td>Inert matter</td>
</tr>
<tr>
<td>1.33%</td>
<td>2.45%</td>
</tr>
<tr>
<td>Weed seed</td>
<td>Weed seed</td>
</tr>
<tr>
<td>.02%</td>
<td>.02%</td>
</tr>
<tr>
<td>Other crop seed</td>
<td>Other crop seed</td>
</tr>
<tr>
<td>2.78%</td>
<td>3.78%</td>
</tr>
</tbody>
</table>

2. Determine purity content

<table>
<thead>
<tr>
<th>Lot 1</th>
<th>Lot 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inert matter</td>
<td>Inert matter</td>
</tr>
<tr>
<td>1.33%</td>
<td>2.45%</td>
</tr>
<tr>
<td>Weed seed</td>
<td>Weed seed</td>
</tr>
<tr>
<td>.02%</td>
<td>.02%</td>
</tr>
<tr>
<td>Other crop seed</td>
<td>Other crop seed</td>
</tr>
<tr>
<td>2.78%</td>
<td>3.78%</td>
</tr>
<tr>
<td>Non-purities</td>
<td>Non-purities</td>
</tr>
<tr>
<td>4.13%</td>
<td>6.25%</td>
</tr>
</tbody>
</table>

100.00% 100.00%
-4.13% -6.25%
95.87% pure seed 93.75% pure seed

3. Cost--Lot 1 is $65.00 cwt, and Lot 2 is $62.00 cwt.
4. Determine value of different lots

Formula

\[
\frac{\text{Price per unit}}{\text{purity} \times \text{germination}} = \text{Price paid per hundred pounds of pure live seed}
\]

\[
\text{Lot 1} \quad \frac{65.00}{.9587 \times .85} = \$80.24 \text{ per hundred pounds}
\]

\[
\text{Lot 2} \quad \frac{62.00}{.9375 \times .80} = \$84.00 \text{ per hundred pounds}
\]

(Note: The seed cost of Lot 2 is more expensive for pure seed, even though the price per hundred weight is slightly lower than Lot 1. Before buying seed, the seed label should be studied. It is the "key" to the best seed buy.)
# Seed Label Requirements

Price per bu. of 60 lbs: $5.00  Price per bu. of 60 lbs: $5.50

Using the preceding information, answer the following questions.

1. How many pounds of pure seed in
   a. Lot A
   b. Lot B

2. How many pounds of pure live seed in
   a. Lot A
   b. Lot B

3. What is the difference between pure seed and pure live seed?

4. How much per bushel will pure live seed cost in
   a. Lot A
   b. Lot B
ASSIGNMENT SHEET #2--COMPARE SEED LOTS

Pure live seed is used as a method of determining seed values by comparing purity and germination in relation to price. In determining seed values use the following formula:

\[
\frac{\text{Price per unit}}{\text{Purity} \times \text{Germination}} = \text{Price per unit of pure live seed}
\]

Obtain at least two seed labels from different lots of the same crop (wheat, beans, etc.). Fill in the needed information from the seed label.

SEED SELECTION
AG 150 - N

ANSWERS TO ASSIGNMENT SHEETS

Assignment Sheet #1

1. a. 57 pounds
   b. 57.9 pounds

2. a. 45.6 pounds
   b. 54.4 pounds

3. Pure live seed considers germination percentage and purity, while pure seed considers only purity.

4. a. $6.58/bushel
   b. $6.06/bushel

Assignment Sheet #2

Evaluated to satisfaction of instructor
LABORATORY EXERCISE #1--THE WARM GERMINATION TEST

Name ___________________________________________  Score ______________________

I. Equipment

A. Adequate supply of corn, bean, wheat and oat seeds

B. A roll of paper towels or strips of absorbent cloth 12 inches wide and 12 to 16 inches in length. The length of cloth strips can be determined by the number of seeds to be tested

C. A bucket, tub or other suitable container to hold the paper or cloth rolls containing the seeds

II. Procedure

A. Select a predetermined number of seeds to be tested (10, 20, 50 or 100)

B. Place the seeds between moistened layers of paper towels or cloths. Seeds should be spaced 1 inch apart for easier counting later

C. Roll up the moistened towels or cloths and place in a suitable container. Keep rolls moist throughout the test period and the temperature at 60\(^{\circ}\)-70\(^{\circ}\)F

D. Mark each roll with an identifying number or letter

E. Check each roll for germination after three days. Count and record the number of seeds that show root or stem sprouts or both. Repeat the above procedure after five days

F. At the end of seven days, count all seeds showing strong stem and root sprouts

G. Calculate the germination percentage by dividing the number of germinated seeds by the total number used in the test (and multiplying by 100)
LABORATORY EXERCISES #2--THE COLD GERMINATION TEST

Name ______________________________________________  Score ______________________

I. Equipment

A. About one gallon of soil-sand mixture (75% soil, 25% sand) is needed for each test to be made

B. A roll of heavy-duty paper towels (made specifically for germination tests) or strips of absorbent cloth 12 inches wide and 2 to 4 feet long

C. Adequate supply of corn and bean seeds. If a comparison between warm and cold germination tests is to be made, the seeds for both tests should come from the same lot

D. A refrigerator where the temperature can be kept at 50°F

II. Procedure

A. Select the seeds to be tested

B. Place the seeds on the paper towels or cloth strips about one inch apart. Sprinkle the moistened soil-sand mixture over the seeds, barely covering them. Cover the seed and soil mixture with another paper towel and roll up. Place in a suitable container and keep rolls moist throughout the test period

C. For one week, place the seed and soil-sand mixture in a refrigerator set at 50°F

D. Remove from the refrigerator to a warmer area of 65°F-70°F for one week to permit germination

E. Count the germinated seeds and calculate germination percentage

F. Observe results and make conclusions
SEED SELECTION
AG 150 - N

LABORATORY EXERCISE #3--THE TZ GERMINATION TEST

Name ______________________________________________  Score ______________________

I. Equipment

A. Adequate supply of corn and bean seed. For comparison purposes, seeds from the same lots used in the warm and cold germination tests should be used.

B. Small supply of 2, 3, 5-triphenyl tetrazolium chloride. This can be obtained from the Idaho Crop Improvement Association.

II. Procedure

A. Soak seeds in warm water at a temperature of 85°F - 100°F for about two hours. (A longer period will do no harm.) This soaking will soften the seeds and activate the enzymes inside them.

B. Cut the seeds to be tested lengthwise through the center to expose the full length of the germ. Seeds are easily cut with a sharp single-edged, safety razor blade.

C. Place halves of the sectioned seeds in a 1.0% solution of TZ. Then warm the solution to 85°F - 100°F or leave at room temperature (75°F). Leave the seed halves in the solution two hours at 85°F - 100°F or four hours at 75°F.

D. Remove seed halves from the solution and examine with a magnifying lens for color changes. All actively respiring parts of the germ become red or deep pink. The endosperm and all dead parts of the germ do not change color. When the entire germ of the seed turns red, the seed is alive and capable of germinating.
SEED SELECTION
AG 150 - N

UNIT TEST

Name ____________________________  Score __________________

1. Match terms associated with seed selection to the correct definitions. Write the correct numbers in the blanks.

   _____ a. Seed which is guaranteed by a state agency to meet certain minimum requirements in respect to purity, germination and other characteristics   1. Seed

   _____ b. Plant embryo and stored food surrounded by a seed coat   2. Breeder seed

   _____ c. Second link in the certified seed chain, produced from breeder seed and handled in such a way as to ensure genetic identity and varietal purity   3. Foundation seed

   _____ d. Percentage by weight of chaff, broken seeds, stems and soil particles   4. Registered seed

   _____ e. Amount of seed when planted that has potential to produce plants   5. Certified seed

   _____ f. No minimum requirements in respect to purity, germination percentage and other characteristics; not inspected by a state agency   6. Common seed

   _____ g. Third link in certified seed chain; seed produced from foundation seed or recertified registered seed   7. Inert matter

   _____ h. Seed which remains hard at the end of the prescribed test because it has not absorbed water due to an impermeable seed coat   8. Hard seed

   _____ i. Seed or vegetatively propagated material that is controlled by the originator; initial source of seed for that variety   9. Pure live seed

2. List four factors to consider in selecting high quality seed.

   a. __________________________________________________________________________

   b. __________________________________________________________________________

   c. __________________________________________________________________________

   d. __________________________________________________________________________
3. Select from the following list conditions that exist when good seed is not selected. Write an "X" in the blank before each correct answer.

- a. Lacks resistance to or is infested by insects
- b. Has small amount of inert matter
- c. Lacks viability
- d. Infested with weed seed
- e. Has large amount of other crop seed
- f. Is adapted to local growing conditions
- g. Resistant to local disease
- h. Low germination percentage

4. List two means of securing good seed.
   a. __________________________________________________________________________
   b. __________________________________________________________________________

5. Arrange in order the certifiable seed classes. Write a "1" before the first step, a "2" before the second step, and so on.

   - a. Foundation seed
   - b. Registered seed
   - c. Certified seed
   - d. Breeder seed

6. Select from the following list information required on certified seed tags. Write an "X" in the blank before each correct answer.

   - a. Date
   - b. Common name of seed
   - c. Vigor index
   - d. Latin binomial name of seed
   - e. Percent by weight of weed seeds
   - f. Germination percentage
   - g. Number of noxious weeds
   - h. Number of common weed seeds
7. Name three types of seed treatment.
   a. 
   b. 
   c. 

8. Select from the following list procedures to follow in handling and storing seed. Write an "X" in the blank before each correct answer.
   ____ a. Make sure seed moisture content for storage is correct prior to harvesting
   ____ b. Inspect seed during storage
   ____ c. Test seed for weed content
   ____ d. Protect from rodents
   ____ e. Treat seed for insects and disease
   ____ f. Store in a warm place with high humidity
   ____ g. Prevent mixing of seed
   ____ h. Control weeds
   ____ i. Select clean seed
   ____ j. Purchase common seed for planting

9. Using the following information, calculate the cost per bushel of pure live seed for both seed lots. Show all work.

<table>
<thead>
<tr>
<th>Lot A</th>
<th>Lot B</th>
</tr>
</thead>
<tbody>
<tr>
<td>Germination .................. 95.0%</td>
<td>Germination.................. 80.0%</td>
</tr>
<tr>
<td>Inert matter.................. 4.5%</td>
<td>Inert matter.................. 3.0%</td>
</tr>
<tr>
<td>Other crop seeds............... 3.0%</td>
<td>Other crop seeds............... .3%</td>
</tr>
<tr>
<td>Weed seeds.................... .2%</td>
<td>Weed seeds.................... .2%</td>
</tr>
<tr>
<td>Price per bu of 60 lbs: $6.00</td>
<td>Price per bu of 60 lbs: $5.50</td>
</tr>
</tbody>
</table>

SEED SELECTION

AG 150 - N

ANSWERS TO TEST

1. a. 5   d. 7   g. 4
   b. 1   e. 9   h. 8
   c. 3   f. 6   i. 2

2. Answer should include four of the following
   Purity; Viability; Free of disease; Free of insects; Size and plumpness

3. a, c, d, e, h

4. Home grown; Reliable seed dealers

5. a. 2
   b. 3
   c. 4
   d. 1

6. a, b, e, f, g

7. Chemical; Pelletizing; Inoculation

8. a, b, d, e, g, h, i,

9. Lot A = $6.84 per bushel of pure live seed

   Lot B = $7.12 per bushel of pure live seed
