Average Daily Gain (ADG)

Cindy A. Kinder, Extension Educator

Goal (learning objective)

Note: Conduct the Frame Size & Market Ready Weights lesson first
Youth will:
- Learn about feeding to market ready weights
- Learn to monitor feed rations during feeding periods
- Learn what “market ready” means
- Learn how to monitor if their animal is on track to be market ready

Supplies

Members will need to bring the following items:
- Animal initial weight information and timely weight information (every 30, 15, or 7 days depending on species) during the feeding period
- Beginning Planning & Record Worksheet (from the Frame Size and Market Ready Weights activity)
- Side photo of their market animal at the beginning of their project
- Copies of Market Animal Growth Charts (distribute the appropriate growth chart to what each member is raising)
  - Handout 1 - “Market Beef Growth Chart”
  - Handout 2 - “Market Goat Growth Chart”
  - Handout 3 - “Market Lamb Growth Chart”
  - Handout 4 - “Market Swine Growth Chart”
- Handout 5 “Market Projects Photo Page” (enough copies for group)
- Pencils, pens (enough for group)
- Rulers and calculators (enough for groups to share)

Pre-lesson preparation

- Conduct the Frame Size and Market Ready Weights Activity first to determine animals target market weight.
- At the beginning of the project take a beginning photo of each project animal. The photo should be a side view of the animal. Side view images will help members see the changes in their animal over time.
- Make copies of the Handouts 1-5.
- Review the activity and refer to the resources section to familiarize yourself with the activity and information covered.

Lesson directions and outline

Share the following information with the youth:

Plotting change in weight over time will help you determine if your market animal is on track to be what is called “market ready” at fair time. It is important to set project goals and identify a target final weight.

Weight gained should be monitored and documented (on the growth chart) from the beginning of the project to fair time. Regular intervals are every 30, 15, or 7 days depending on species.

Monitoring weight gain can help you determine if feed rations need to be adjusted so that animals make it to fair, market ready.

Industry average for average daily gain (adg) for each species is as follows: Beef 2.5 lbs/day, Swine 1.7 lbs/day, Sheep .5 lbs/day and Meat Goat .3 lbs/day.
**Conducting the activity (DO)**

1. Follow the directions on the growth chart to determine a predicted growth rate using the initial weight and estimated final weight of each animal.

2. Have members review the beginning pictures of the animals (side profile view) to determine if an animal is changing in condition.

3. Have members weigh project animals every 30, 15, or 7 days (depending on species) and record the weights and plot the “actual” growth of each animal on the Market Growth Chart.

4. Help members determine if animals are above or below the predicted growth rate.

5. Work with members to finish the growth chart and take an ending photo of their animal.

6. Ask: Do animals change over the feeding period? Is there anything you would do differently next year?

**What did we learn? (REFLECT)**

- Ask: What is industry standard for ADG?
- Ask: Is your predicted ADG achievable?
- Ask: Is your animal above or below the predicted ADG? What caused any problems?
- Ask: How should you adjust your feeding if your animal is below your predicted ADG?
- Ask: How did your animal change the most? Was this change due to normal growth or your feed program?
- Ask: How did your animal change the least? Was this lack of change due to normal growth or your feed program?

**Why is that important? (APPLY)**

By monitoring and adjusting your feeding program during the feeding period members can be effective in making sure their animal is market ready by fair.

- Ask: What could happen if you waited to adjust your feeding program until two weeks before fair?
- Ask: What happens if your animal does not make weight for the sale?
- Ask: How does this apply to goal setting?
- Ask: How can you apply this to schooling plans beyond high school? What happens if you don't finish a class or drop it? Does that extend your time? Does that cost more?

**Resources**

Market Beef Growth Chart

To achieve success with your 4-H Market Beef project, it is important you know the estimated final weight of your animal and your progress toward that goal throughout the feeding period. The chart below enables you to plot the predicted growth curve (immediately after the initial weigh-in) and then plot the actual weight of your animal at various times during the feeding period to determine if you are “on target.”

1. Mark the initial weight at the appropriate location on the left-hand side of the table.
2. Mark the estimated final weight at the appropriate location for the number of days in the feeding period.
3. Connect these two points with a straight line. Label this your “predicted” rate of growth.
4. Record your animal’s weight in the table below and the chart above each time it is weighed during the feeding period. Connect this point with the previous actual weight. Is the actual growth curve above or below your predicted growth line? Why?

Progressive Project Weight Record

<table>
<thead>
<tr>
<th>Weigh date</th>
<th>Days since last weigh day</th>
<th>Current weight</th>
<th>A.D.G. (since last weigh date)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Tracking animal weight can tell you where your animal is compared to your goal. After each weigh day ask yourself; do you need to feed more grain or hay?

Typical influences in A.D.G. can be feed, water, weather, and illness. Ask yourself is the A.D.G. normal? What caused any problems?
Market Goat Growth Chart

To achieve success with your 4-H Market Goat project, it is important you know the estimated final weight of your animal and your progress toward that goal throughout the feeding period. The chart below enables you to plot the predicted growth curve (immediately after the initial weigh-in) and then plot the actual weight of your animal at various times during the feeding period to determine if you are “on target.”

1. Mark the initial weight at the appropriate location on the left-hand side of the table.
2. Mark the estimated final weight at the appropriate location for the number of days in the feeding period.
3. Connect these two points with a straight line. Label this your “predicted” rate of growth.
4. Record your animal’s weight in the table below and the chart above each time it is weighed during the feeding period. Connect this point with the previous actual weight. Is the actual growth curve above or below your predicted growth line? Why?

NUTRITION: AVERAGE DAILY GAIN – HANDOUT 4

Market Swine Growth Chart

To achieve success with your 4-H Market Swine project, it is important you know the estimated final weight of your animal and your progress toward that goal throughout the feeding period. The chart below enables you to plot the predicted growth curve (immediately after the initial weigh-in) and then plot the actual weight of your animal at various times during the feeding period to determine if you are “on target.”

<table>
<thead>
<tr>
<th>Initial</th>
<th>+15</th>
<th>+30</th>
<th>+45</th>
<th>+60</th>
<th>+75</th>
<th>+90</th>
<th>+105</th>
</tr>
</thead>
<tbody>
<tr>
<td>Days since initial weigh-in</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Initial weight: __________________    Estimated final weight: __________________

1. Mark the initial weight at the appropriate location on the left-hand side of the table.
2. Mark the estimated final weight at the appropriate location for the number of days in the feeding period.
3. Connect these two points with a straight line. Label this your “predicted” rate of growth.
4. Record your animal’s weight in the table below and the chart above each time it is weighed during the feeding period. Connect this point with the previous actual weight. Is the actual growth curve above or below your predicted growth line? Why?

**Progressive Project Weight Record**
