

IRIC Solar Array Installation

Made possible after several years of fundraising and a highly successful crowdfunding campaign, the university is in the process of installing a 147kW photovoltaic array on the roof of the IRIC building. The array will span across both levels of the roof and an interactive display will be installed for the general public. Capable of offsetting a significant amount of the building's electrical load, the project is estimated to save the university over \$11,000 annually. Construction began Monday, August 3, 2020. The anticipated project completion date is September 2020.
